

Supplementary Figure S1

Supplementary figure1. HCT 116 cells were serum-starved for 24 hours and then stimulated for 1, 6, 12 or 24 hours with WKYMVm (A) or ANXA1 (B). Fifty-five micrograms of whole lysates were resolved on 10% SDS-PAGE and incubated with an anti-SLC7A11/xCT (α -SLC7A11/xCT) antibody. An anti-tubulin (α -tubulin) antibody was used as a control of protein loading. Data are representative of 3 different experiments. * $p < 0.05$ compared to unstimulated cells.
