## Figure Captions

**Figure S1.** EDX spectrum of the GaSe single crystal.

**Figure S2.** Out-of-plane Raman spectra of the GaSe single crystal with various polarization angles.  $0^\circ$  denotes the incident light polarized parallel to the c-axis.

**Figure S3.** Point-by-point fitting method used to remove surface roughness artifacts for the pseudodielectric functions along (a) the c-axis and (b) the a-axis of GaSe at 27 K. Data are given by dashed curves and fitted results by solid curves.

**Figure S4.** The graph shows the imaginary part  $\epsilon_2$  of the dielectric functions of GaSe. The solid lines represent the data from the present work. For comparison, digitized versions of previously reported data from Ref. [30] are also included.

**Figure S5.** Comparison of c-axis lineshape fitting assuming one and two critical points in the exciton region of the GaSe single crystal at 27 K.

**Figure S6.** The energy band structure of GaSe calculated before (solid curve) and after (dashed curve) bandgap correction using the mBJ method.
