Publication Bias

Figure S1. Funnel plot ADHD vs ADHD+ASD
Rank Correlation test for funnel plot asymmetry shows no indication of publication bias (Kendall's tau=0.183, p=0.094)

Figure S2. Funnel plot ASD vs ADHD+ASD

Rank Correlation test for funnel plot asymmetry shows no indication of publication bias (Kendall's tau=0.124, p=0.258)

Table S3. Descriptive Statistics of the comorbidity group (ADHD+ASD)

Variable	ADHD+ASD (N=298)	
	Mean	*SD*
Age	10.3	0.747
IQ	104	3.29
Females	32 (11%)	

Main Analyses: ADHD vs ADHD+ASD comparison

Comparing ADHD to the double diagnosis group resulted in a non-significant effect, $Z = 0.517$, $p = 0.605$, associated to a low Cohen's $d = 0.04$ ($SE = 0.08$, CI = [-0.12, 0.20]). This result meant that on the executive profile assessed through neuropsychological test, the ADHD group and the double diagnosis group did not differ. Test for the residual heterogeneity was still significant, $Q(36) = 94.507$, $p < .001$

Main Analyses: ASD vs ADHD+ASD comparison

On the contrary, comparing ASD to ADHD+ASD resulted in a significant effect, $Z = 3.648$, $p < .001$, $d = 0.22$ ($SE = 0.06$, CI = [0.101, 0.335]), meaning that, on neuropsychological test, the ASD group generally performed better than the double diagnosis group, with an effect size of small magnitude. The heterogeneity statistic was significant, $Q(36) = 53.456$, $p = 0.031$

Table S4. Results of the standardized differences between ASD, ADHD and ADHD+ASD.
