Figure S- 7: LC-MS of Triazole 1

The LC of the click reaction showed a peak at around 4 minutes, which showed the expected mass of Triazole 1 (Exact Mass: 235.11, observed m/z 236.1, $[M+H]^+$)

Method S- 1: Quantification of CuAAC reaction yield from NMR

Quantification of CuAAC reactions that precipitate by dissolving lyophilized reaction mixture with a high percentage of acetonitrile (80 or higher) and calculating the percentage yield from the NMR of this solution: When CuAAC reactions precipitated with higher triazole formation, the reaction was stopped, the reaction mixture was lyophilized and then dissolved in a solvent with 80% or more acetonitrile, and the yield of the triazole was calculated from the NMR of the solutions with high percentages of acetonitrile.

The conversion was calculated from every measured sample by integrating the proton at position a of the starting material (terminal alkyne) and normalizing that integral to be one. The peaks of each proton at positions 1, 2, and 4 of the Triazole product are integrated, and each percentage yield is calculated with respect to the proton at position a. A similar calculation was done normalizing the integral for protons at position b of the starting material (CH₂ azide) to 2 and then integrating peaks at positions 1, 2 or 4 to and calculating the % yield for each position with respect to proton b. The average percentage yield value was calculated by averaging the percentage yields for position 1 with respect to (wrt) position a, position 1 wrt position b, position 4 wrt position a, position 4 wrt position b, position 2 wrt position a, and position 2 wrt position b (therefore an average of six percentage yield calculations). Table Con1 show the normalization calculations in which the integral at position 4 is normalized to 1. Table Con2 lists the % conversation calculations for position 1 wrt position a, position 1 wrt position b, etc, which were then averaged to give the final average yield of a reaction cycle. The yields for 3 reaction cycles are shown in Table Con2.

Method S- 2: Monitoring of triazole 1 formation in solutions with 50 % or more water content

TMS was used as a standard for comparison of CuAAC reactions done in solvents with 50% water or more. In the closed tube, the amount of TMS was assumed to be constant. The TMS integral was set to 1.0, and the percentage yield was calculated by subtracting the changed integral for the alkyne proton from the integral value for the alkyne proton at 0 hours, and calculating the change as a percentage of the integral of alkyne proton 1 at 0 hours.

Method S- 3: Calculation of percentage yield of Triazole 5.

The identification of the product portion shifts in the ^1H NMR was vital for the calculation of the conversion to triazole 5 (shown in Figure S-16) In Figure S-16C the ^1H NMR of 4-(azidomethyl)-7-hydroxy-2H-chromen-2-one shows the shifts of the starting material (azide). The spectrum of the sample in Figure S-17B showed a very small conversion to Triazole 5 (7-hydroxy-4-((4-phenyl-1H-1,2,3-triazol-1-yl)methyl)-2H-chromen-2-one) (red arrows). The conversion was high for the sample depicted in Figure S-16A and matched the chemical shifts indicated by the arrows in Figure S-16B. After lyophilization of the sample, unreacted azide and formed triazole remained in the sample. The triazole peaks that newly formed were integrated, normalized to one or two protons, and compared to the integral of the remaining azide- CH_2 shift at 4.75 ppm.

Figure S- 19: Purification of Triazole 7.

Part of the crude compound mixture, dissolved in DMSO, was analyzed and purified by reversed phase high performance liquid chromatography (RP-HPLC). The collected fractions P1, P2 (retention times 10.7 minutes, 11.2 minutes) had the same mass values. Using this method, a separation of the two triazole products was not possible (gradient pH 2 1% ACN – 90 % ACN, 70 min). The mixture of the triazole products was labeled Triazole 7.

P1 and P2 had the same mass and was identified as the product Triazole 7. P3 was the starting material coumarin-alkyne.

Method S- 4: Calculation of conversion to triazole 7.

The conversion to Triazole 7 is calculated by ^1H NMR spectrum of the crude mixture after removal of the solvents and dissolving the sample in $\text{d}_6\text{-DMSO}$. The integrated values for the newly formed triazole protons at 6.26 and 5.50 ppm were used to calculate the percentage yield with respect to the starting material in relation to the normalized integral of the remaining alkyne at 5.17 ppm (CH_2 , normalized integral to 2.0) and the proton in the lactone ring of the alkyne at 6.05 ppm (CH , normalized integral to 1.0) were used (figure S-21) The normalized peaks were adjusted differently depending on whether they were compared to a single proton or two protons.

Figure S- 22: Determination of conversion to triazole 7 by ^1H -NMR.

A) integration of protons in crude reaction mixture; B) For percentage yield, the integrals of the triazole protons in positions 1 and 2 (product) was expressed as a percentage of the total integrals for the product and the starting material (normalized alkyne protons in positions a or b.

We integrated values of crude reaction mixture with remaining 4-(prop-2-yn-1-yloxy)-2H-chromen-2-one to calculate the conversion.

6.22 ppm	6.00 ppm	5.45 ppm	5.14 ppm
tz-CH	CH-lactone	CH₂-lactone	CH₂-alkyne (b)

From the table, percentage yield 1 wrt position a = $\frac{3.69}{3.69+1} * 100 = 78.6$ (when integral for proton at position a normalized to 1)

percentage yield 2 wrt position b = $(8.48/10.72)*100 = 79.1$ (when integral for proton at position a normalized to 1)

percentage yield 3 wrt position a = $(3.29/4.19)*100 = 78.5$ when integral for proton at position b normalized to 2)

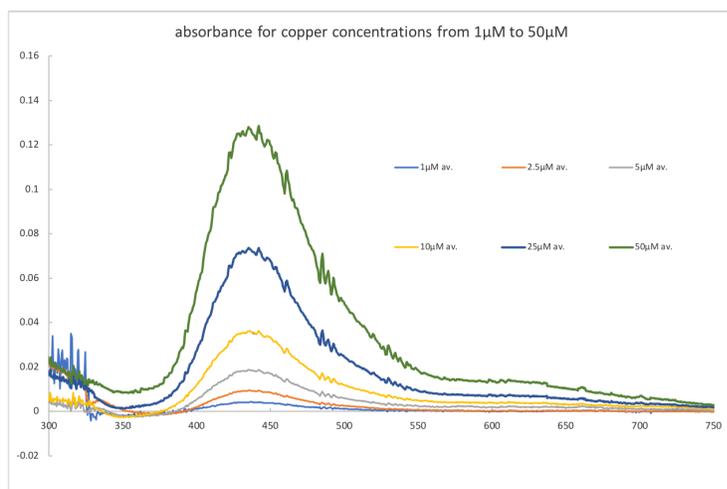

percentage yield 4 wrt position b = $(7.57/9.57)*100 = 79.1$ when integral for proton at position b normalized to 2)

The average of those 4 values was reported as the percentage yield.

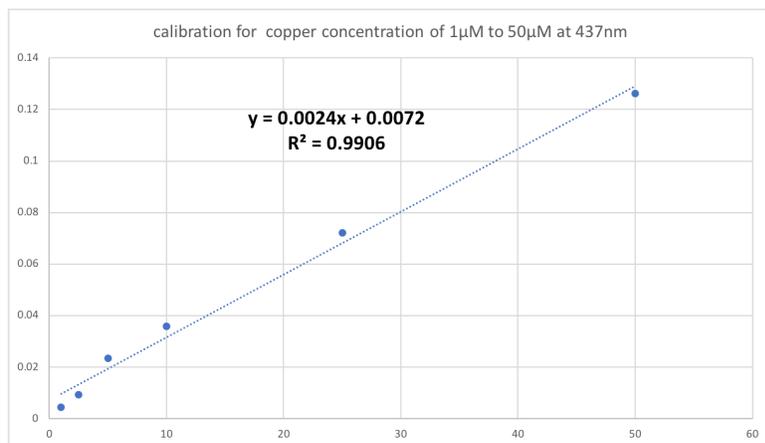

Figure S- 23: Monitoring of leaching of copper from resin using the absorbance of $[\text{Cu}-(\text{DDTC})_2]$

A. Absorbance monitored for 1 μM to 50 μM $[\text{Cu}-(\text{DDTC})_2]$ solutions in DMF. B. The standard curve drawn has an R^2 of 0.96. C. On washing a previous version of the catalyst (not reported in this paper) bound to resin from the $\text{Cu}(\text{DDTC})_2$ calibration, it could be estimated how much nmoles of copper was removed in each DMF wash, after synthesis. After the 5th wash, no further change could be detected due to minimal formation of $\text{Cu}(\text{DDTC})_2$. The catalyst was used only after 10-12 washes, and no $\text{Cu}(\text{DDTC})_2$ was found. For the new catalyst reported in this work, no formation of $\text{Cu}(\text{DDTC})_2$ could be detected in the washes after the synthesis of the catalyst by monitoring the absorbance of $\text{Cu}(\text{DDTC})_2$ at 475 nm.
