

Table S1. Cotyledons fresh weight (FW) and dry weight (DW) of shoots, roots and cotyledons of 22-days-old pea seedlings, developed without infection (control), infected (on the 8th day of germination, DG) with *D. pinodes* or *F. avenaceum* after pre-treatment with water, fungicide and bio-AgNPs (at 100 and 200 mg/L).

		Seedlings infected after short-term immersion in				
		Control	Water	Fungicide*	bio-AgNPs	
					100 mg/L	200 mg/L
<i>D. pinodes</i> infection	FW (mg)	cotyledons	302.3 ^a	275.8 ^a	307.2 ^a	276.5 ^a
	DW (mg)	shoots	34.6 ^a	29.5 ^a	30.3 ^a	34.8 ^a
		roots	14.8 ^a	13.1 ^a	15.0 ^a	16.0 ^a
<i>F. avenaceum</i> infection	FW (mg)	cotyledons	73.6 ^a	74.9 ^a	76.5 ^a	70.9 ^a
	DW (mg)	shoots	261.4 ^{ab}	219.7 ^b	255.3 ^{ab}	109.9 ^a
		roots	47.9 ^a	38.9 ^a	45.7 ^a	46.3 ^a
		cotyledons	24.8 ^a	26.7 ^a	22.3 ^a	24.4 ^a

Means of 3 replicates. The same letters (a-b) by the values indicate statistically insignificant ($P<0.05$) differences (valid for roots, shoots and cotyledon separately) based on ANOVA analysis and Tukey's post-hoc corrections.

* The fungicide Amistar 250 SC (22.82% of azoxystrobin) was used against *D. pinodes* and Toledo Extra 430 SC (33.29% of tebuconazole) against *F. avenaceum*.

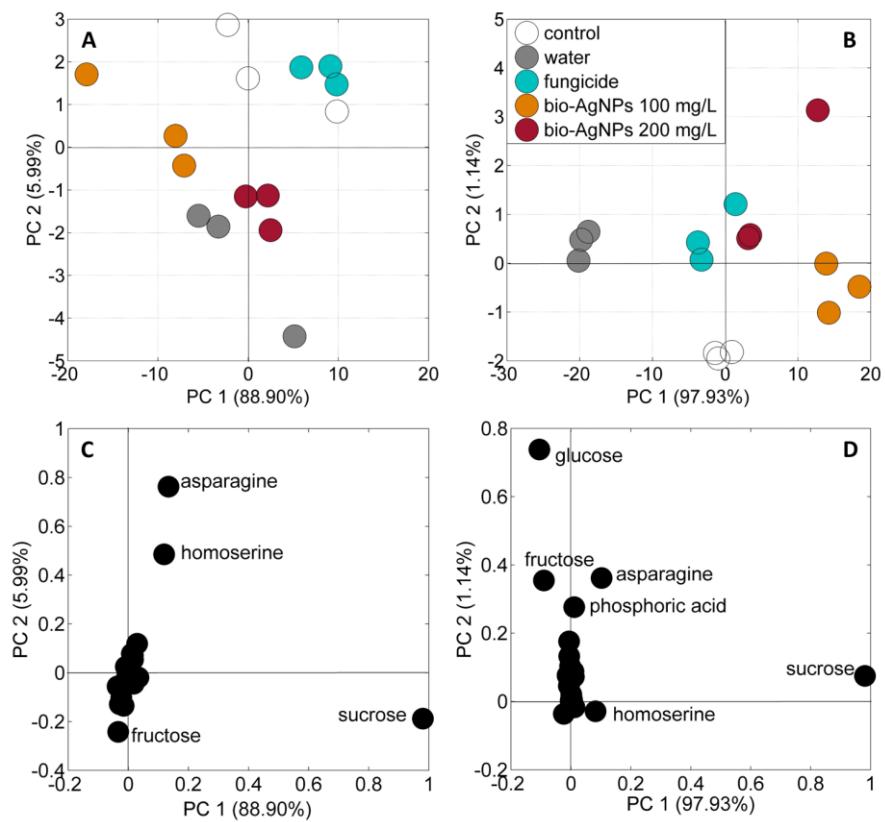

Figure S1. PCA (A, B) and loading plots (C, D) of cotyledon's metabolic profiles of 22-day-old seedlings of pea (*Pisum sativum* L.), 14 days after *D. pinodes* (A, C) and *F. avenaceum* (B, D) inoculation, respectively. Abbreviations: control – non-infected seedlings; water, fungicide, bio-AgNPs 100 and 200 mg/L – seedlings pretreated with water, fungicide (azoxystrobin or tebuconazole, respectively) or bio-AgNPs (at 100 and 200 mg/L), respectively, before infection with *D. pinodes* or *F. avenaceum*.

Table S2. The concentration of total identified polar metabolites (TIPMs), including total soluble carbohydrates (TSCs), total amino acids (TAAs), total organic acids (TOAs), and total remaining compounds (TRCs) **in roots** of 22-day-old pea seedlings (*Pisum sativum* L.), 14 days post-inoculation with *D. pinodes*.

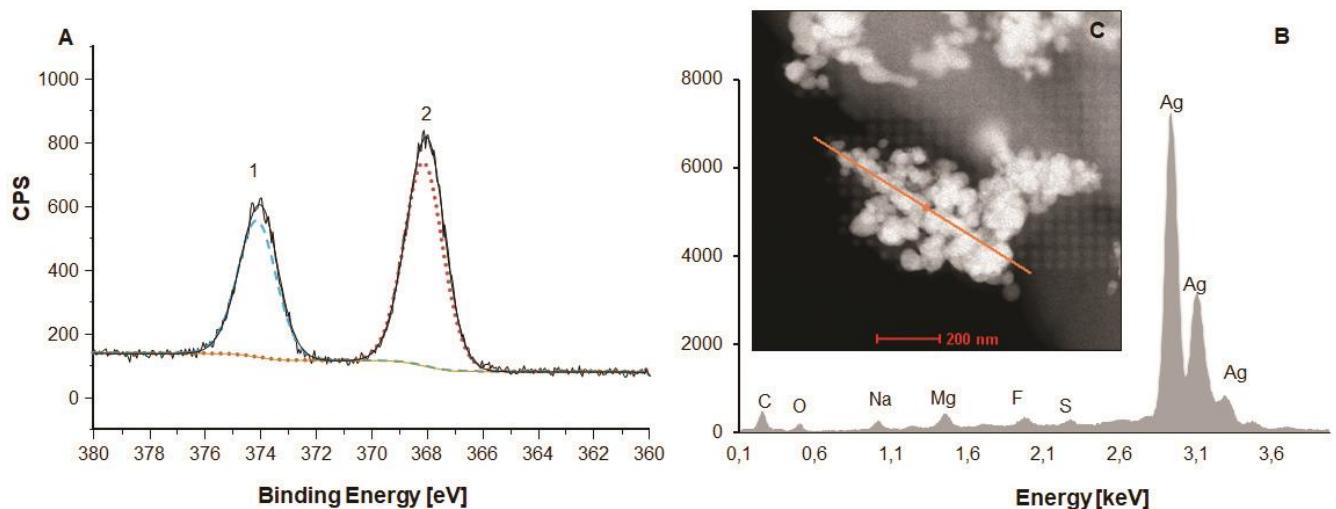

Figure S2. Characterization of bio-synthesized silver nanoparticles (bio-AgNPs) (A) X-ray Photoelectron Spectroscopy (XPS) wide-scan spectrum showcasing the surface chemical composition of bio-AgNPs. This spectrum displays prominent silver peaks at binding energies characteristic of $\text{Ag}(3\text{d}_{5/2})$ at 368.1 eV and $\text{Ag}(3\text{d}_{3/2})$ at 374.1 eV, with a full width at half maximum (FWHM) of 1.5 eV and an energy separation (ΔE) of 6 eV, indicating the presence and purity of silver in the nanoparticles; (B) Energy Dispersive X-ray (EDX) spectra, providing elemental composition analysis which confirms the presence of elemental silver as a major constituent along with minor traces of other elements used in the synthesis process; (C) Transmission Electron Microscopy (TEM) images in darkfield mode, revealing the morphology and size distribution of the bio-AgNPs.
