Figure S1. Heatmap showing estimated frequencies of the 36 mutations (known and novel) identified in the viral genome from samples of the four patients analysed in the present study. Each column represents a year. Variants are ordered by year of detection. Each row represents a single variant. Colours depict the mutation frequency in the database: the clearer colour indicating the higher mutation frequency. The heatmap was generated using the function heatmap from the Python data visualization library seaborn (<https://seaborn.pydata.org/generated/seaborn.heatmap.html>, last accessed 5 July 2023).

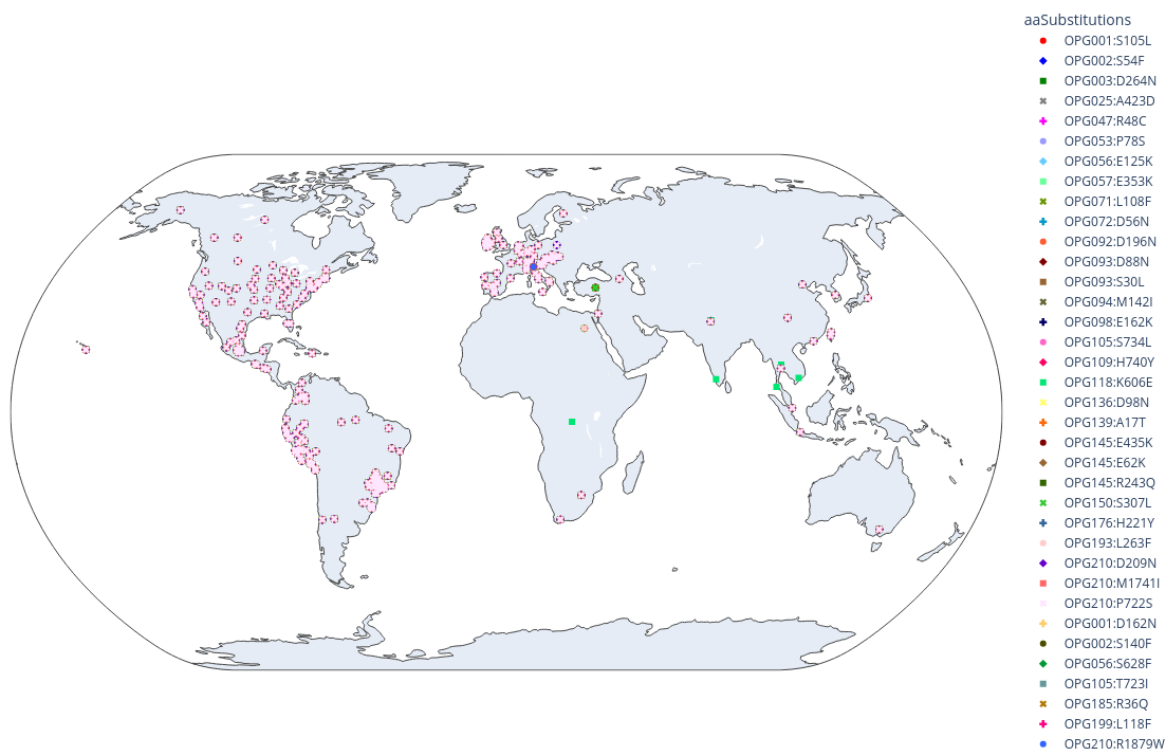

Figure S2. Geographic spread of the 37 SNVs.
