Spearman's rho, p and n= for baseline variables. Significance is shown in bold. \*\*Correlation is significantly at the 0.01 level(2-tailed). \*Correlation is significant at the 0.05 level(2-tailed). Post hoc analysis indicated ≥82% power to detect a correlation coefficient ≥0.18 at baseline in bivariate analyses. BMI: body mass index; CAPF: central aspects of pain factor; PPT: pressure pain threshold (proximal tibial); JSON=joint space narrowing; US=ultrasound; sex: male=1 and female=2.

\*\*Correlation is significant at the 0.01 level(2-tailed). \*Correlation is significant at the 0.05 level(2-tailed). Post hoc analysis indicated ≥80% power to detect  $r \geq 0.26$  between baseline variables and year 1 quadriceps strength in bivariate analyses. BMI: body mass index; CAPF: central aspects of pain factor; PPT: pressure pain threshold (proximal tibial); JSN=joint space narrowing; US=ultrasound; sex: male=1 and female=2.

Supplement table S3: Examining the component items of the Central aspects of pain factor and their association with muscle strength.

Each individual item from the CAPF was assessed for its Spearman's correlations with muscle strength at baseline and at 1 year follow up. 95% CI were calculated from 1000 bootstrap draws.

		Baseline		1 year
