Supplementary materials

Figure S1. Effect of CFS from two probiotic strains *L. acidophilus* AG01 and *B. animalis* AG02 (30 µl/ml) on CHIC-8E11 cell permeability.

Figure showing the effect of probiotic cell-free supernatants harvested from *L. acidophilus* AG01 and *B. animalis* AG02, on CHIC-8E11 permeability. Permeability is measured using the Fluorescein Isothiocyanate-dextran (FITC-D) permeability assay and is expressed as a percentage of the amount (µg) of FD4 in the basolateral compartment of cell culture inserts relative to that in the apical compartment after overnight incubation at 37°C in an atmosphere of 5% CO₂. The reduction in permeability (%) was calculated relative to the medium control (without probiotic CFS pre-treatment). Experiments were performed

three times with 6 replicates. Values represent means \pm SD. *, statistically significant at $P < 0.05$; **, statistically significant at $P < 0.01$; n.s., non-significant at $P < 0.05$.

Table S1. Proteins, TaqMan ID numbers and expression results for CHIC 8E11 cell line verification.

Proteins (Gene Name)	Major Cell Source	TaqMan ID No.	Expression (±)		
			CHIC 8E-11	Caco-2	IPEC-J2
Chicken

+, $\Delta CT \leq 25$ cycles; –, $\Delta CT > 25$ cycles or not detectable.

Description of data: Table listing the selected proteins, associated TaqMan ID numbers and cell expression results (+/–) in CHIC-8E11 cells compared with Caco-2 and IPEC-

J2 cells, as part of the pre-experimental confirmation of IPEC-J2 cell line as a chicken cell line of intestinal epithelial origin.
