

Figure S2 Bevacizumab-IRDye 800CW had longer circulation time in the blood than Angiostamp800 and ICG. Healthy mice were injected intravenously with Angiostamp800, Bevacizumab-IRDye 800CW, or ICG, and fluorescence imaging of blood plasma samples collected at different time points were performed. Results are expressed as a percentage of the initial maximum signal (mean \pm SEM; n = 3).
