Supplementary Materials

1. Pressed expanded graphite (EG) pellets

The skeleton density of the expanded graphite (EG) was evaluated performing 99 measurements through Anton PAAR Ultrapyc 5000 helium pycnometer for comparison with graphite theoretical density (2.26 g/cm³) due to the open nature of the porosity. In order to occupy enough volume of the chamber, having volume of 4.5 cm³, the EG powder was cold compacted obtaining two disks having diameter of 13 mm (Figure S1). The obtained density was 2.268 ± 0.004 g/cm³, perfectly matching the theoretical value.

Figure S1. Pressed EG disks of 13.0 mm of diameter for the evaluation of density. On the left density 1.87 g/cm³ (2.274 g, thickness 9.16 mm), on the right density 1.90 g/cm³ (0.823 g and 3.27 mm thickness).

The disk of thickness 3.27 mm was then used for the determination of the thermal conductivity with laser flash analysis (LFA).

2. Thermal gravimetric analysis (TGA) in air atmospheres

In Figure S2 the TGA curves in air of neat PA-SA, EG and samples investigated as residual mass and derivative of weight loss (DTGA) are reported, while in Table S1 the characteristic temperatures and weight fractions are listed.

(a)

(b)

Figure S2. TGA curves in air atmosphere: (a) Residual mass; (b) Derivative of mass loss (DTGA).

Table S1. Selected results of TGA and DTGA analyses in air.

Sample	T_{onset} [°C]	$T_{5\%}$ [°C]	T_{peak} [°C]	m_{200} [wt.%]	m_{500} [wt.%]	m_{600} [wt.%]	m_{700} [wt.%]
PA-SA	165.5	226.7	289.2	98.6	1.0	0.0	0.0
PA-SA/EG10	161.0	224.2	289.3	98.6	9.9	8.3	7.6
PA-SA/EG12	158.0	222.0	285.0	98.4	11.9	10.4	9.9
PA-SA/EG14	151.8	214.5	279.8	97.4	13.3	11.8	11.1
EG	-	-	-	99.8	98.1	98.3	96.0

PCM oxidation between 325 °C and 400 °C, which does not occur in nitrogen atmosphere (Figure 7 and Table 3), is observable, accompanied to less pronounced mass loss in this temperature range.

3. Differential scanning calorimetry (DSC)

In Table S2 the transition enthalpies and temperatures (peak and interval) at the different scanning rates are reported (Figure 8).

Table S2. Results of DSC tests at 0.1 °C/min, 1 °C/min and 10 °C/min of neat PA-SA.

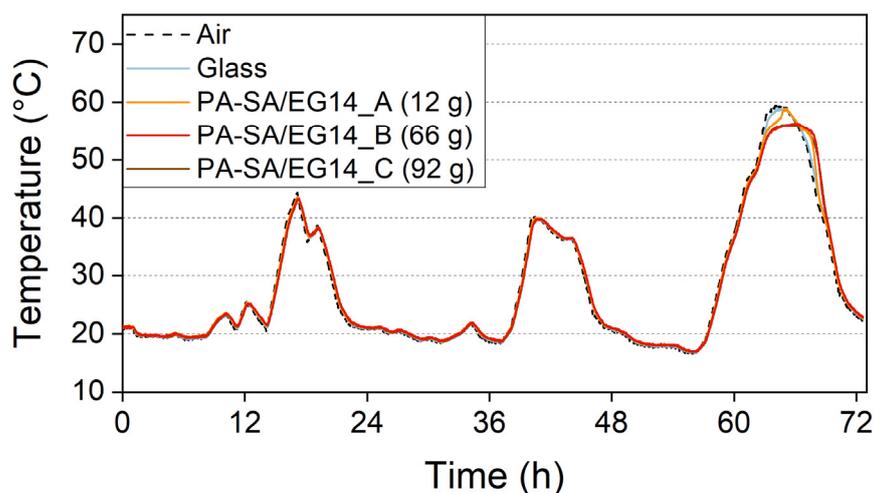

Scanning rate [°C/min]	T_m [°C]	ΔT_m [°C]	ΔH_m [J/g]	T_c [°C]	ΔT_c [°C]	ΔH_c [J/g]
0.1	53.3	51 - 54	191.5	51.3	52 - 49	191.3
1	54.6	50 - 56	195.4	49.5	52 - 43	193.3
10	59.6	50 - 68	198.3	44.3	50 - 34	195.6

T_m : melting temperature peak; ΔT_m : melting temperature interval; ΔH_m : melting enthalpy; T_c : crystallization temperature; ΔT_c : crystallization temperature interval; ΔH_c : crystallization enthalpy.

Similar values of enthalpy changing the scanning rate are noticeable, while increasing it, a shift toward higher melting temperatures and lower crystallization temperatures occurs, accompanied to a broadening of the transition temperature interval due to thermal inertia effects.

4. Test in climatic chamber

In Figures S3–S6 magnifications of the temperature profiles obtained from the tests into climatic chamber are reported and in Tables S3–S6 for each subsequent day (superscript number) the time to reach 57 °C during heating (t_{57}) from the start of the test, the maximum daily peak temperature (T_{max}), the time to reach 53 °C in cooling (t_{53}) and the minimum temperature (T_{min}) are listed.

5. Thermal management systems properties comparison

In Table S7 the main properties of the three studied composite materials are summarized.

Table S7. Properties comparison of thermal management systems.

TMS bricks	ρ [g/cm ³]	SD [kg/m ²]	c_{p30} [J/(g K)]	λ_{30} [W/(m K)]	T_m [°C]	T_c [°C]	ΔH_m [J/g]	TMA [MJ/m ²]
PA-SA/EG10	0.92	18.4	1.97	4.6	54.5	50.2	181	3.4
PA-SA/EG12	0.93	18.6	1.93	7.5	53.4	50.9	176	3.3
PA-SA/EG14	0.94	18.8	1.93	8.3	53.6	50.7	169	3.2

ρ = density, SD = surface density of a panel of thickness 2 cm, c_{p30} = the specific heat capacity at 30 °C, λ_{30} = thermal conductivity at 30 °C, T_m = melting temperature, T_c = crystallization temperature, ΔH_m = melting enthalpy, TMA = thermal management ability of a system having thickness 2 cm normalized to the surface, which corresponds to the heat that the device is able to remove from the PV cell.
