

Supplementary Text

Supplementary Text S1: Protocol under Avizo 8.1.

1. Orientation

The anonymized scan data were opened using Avizo 8.1 and visualized using the orthoslice tool (values between -500 and 2000), and the isosurface tool (threshold from 500 to 600). First, the scans were re-oriented according to the Frankfort plane, defined by three anatomic landmarks (rPo, rOr and lOr).

Position of three anatomic landmarks on the isosurface (rPo, rOr, lOr).

Second, the scans were re-oriented according to the midsagittal plane, defined by three anatomic landmarks (Na, ANS and MGNM).

Position of 3 landmarks on the isosurface and orthoslice (Na, ANS, FM).

2. Volume Segmentation

The segmentation was performed semi-automatically using the software tool “Image Segmentation - Edit New label field”. The threshold tool was adjusted to around 440, and the upper and lower boundaries of the upper airway were placed on the midsagittal orthoslice. Then, the upper airway was selected on the sagittal view. The cross-sectional areas were computed using the tool “measure and analysis” and the minimal value was considered (CSA_{min}). The corresponding slice of the airway was used to compute the width and the length.

Volume segmentation of the upper airway in the sagittal plane.

Length (anteroposterior) and width (lateral) of the CSA_{min}

3. Anatomical landmarks

Using the software tool “Create object – Landmarks”, the observer placed all the anatomical landmarks in the same order (from 1 to 24) using the three orthoslices (midsagittal, axial and frontal views) and the isosurface.

Na, Pg, S, A, B and Me

rTb and ITb

rGo and lGo

PNS, ANS, BEP, TUV, Ba, Tph, H and C3

rCN, lCN

LP at the intersection of the three planes: midsagittal plane; axial plane passing through the PNS-ANS; frontal plane on the most posterior part of the soft palate

VSP at the intersection of the three planes: midsagittal plane; axial plane passing through the TUV; frontal plane on the most posterior part of the soft palate

Positioning of some landmarks.

Supplementary Text S2: Normalized fitness-weighted variable importance and magnitude of effects

Definition of the normalized fitness-weighted variable importance

Fitness-weighted variable importance FWI is calculated using all models. It first uniformly distributes the fitness (mean absolute error) of each model $M = \{j = 1, \dots, m\}$ over all d variables present in it ($\delta(ki, Mj)$). Then, it sums up the scores over all models.

$$FWI (xi, M) = \sum_{j=1}^m \frac{fitness(Mj)}{\sum_{i=1}^d \delta(ki, Mj)} \delta(ki, Mj)$$

The normalized fitness-weighted variable importance NFWI was used.

$$NFWI (xi, M) = \frac{FWI (xi, M)}{\sum_i FWI(ki, M)} \cdot 100\%$$

Definition of the magnitude of effects

For a model equation of the form $z = f(x, y \dots)$, the positive magnitude is defined as $\left| \frac{\partial z}{\partial x} \right| \cdot \frac{\sigma x}{\sigma z}$, at all points where $\frac{\partial z}{\partial x} > 0$ and the negative magnitude as $\left| \frac{\partial z}{\partial x} \right| \cdot \frac{\sigma x}{\sigma z}$, at all points where $\frac{\partial z}{\partial x} < 0$.

$\frac{\partial z}{\partial x}$ is the partial derivative of z with respect to x ,

σx is the standard deviation of x in the input data,

σz is the standard deviation of z

The mean magnitude of effects for each contributing variable was computed from the best model equation of each experiment. Magnitude of effects means that when the variable increases, there is an increase (positive magnitude) or a decrease (negative magnitude) in the target variable.

Supplementary Table S1: Results for the symbolic regression analysis of CSAmin. Metrics associated for each solution found for each of the 10 experiments in Eureka software.
