<sup>a</sup>: Kruskal Wallis test was used for statistical analysis, <sup>b</sup>: Freidman ANOVA test was used for statistical analysis, \*: statistically significant, values are expressed as [median, (IQR)], for all statistical tests used  $p < 0.05$  considered statistically significant. TLC: Total Leucocyte Count. Within group1, the hemoglobin level increased across the cycles but there was no significant difference compared to other groups. In group 2, platelets count increased from baseline to the 2nd cycle ( $p < 0.001$ ) and 3rd cycle ( $p < 0.001$ ). Platelets counts also increased in group 1 after the end of 3rd cycle ( $p = 0.031$ ) compared to baseline in group 1. The platelet count increased in group 3 as well, although it was not deemed significantly different.

<sup>a</sup>: Fisher's Exact Test was used for statistical analysis. AST: Aspartate Aminotransferase, ALT: Alanine Aminotransferase. For all statistical tests used, p<0.05 is considered statistically significant.

**Table S6. Common Terminology Criteria for Adverse Events (CTCAE) definitions for adverse effects encountered in the current study.**

|   |  |
|---|--|
| <b>Abdominal pain</b>                       |  |
| Definition                                  | “A disorder characterized by a sensation of marked discomfort in the abdominal region.”  |
| Grades                                      | Grade 1: “Mild pain.”  |
| <b>Alanine aminotransferase increased</b>   |  |
| Definition                                  | “A finding based on laboratory test results that indicate an increase in the level of alanine aminotransferase (ALT or SGPT) in the blood specimen.”         |
| Grades                                      | Grade 1: “>ULN - 3.0 x ULN if baseline was normal; 1.5 - 3.0 x baseline if baseline was abnormal.”   |
| <b>Aspartate aminotransferase increased</b> |  |
| Definition                                  | “A finding based on laboratory test results that indicate an increase in the level of aspartate aminotransferase (AST or SGOT) in a blood specimen.”         |
| Grades                                      | Grade 1: “>ULN - 3.0 x ULN if baseline was normal; 1.5 - 3.0 x baseline if baseline was abnormal.”   |
| <b>Blood bilirubin increased</b>            |  |
| Definition                                  | “A finding based on laboratory test results that indicate an abnormally high level of bilirubin in the blood. Excess bilirubin is associated with jaundice.” |
| Grades                                      | Grade 1: “>ULN - 1.5 x ULN if baseline was normal; > 1.0 - 1.5 x baseline if baseline was abnormal.”   |
| <b>Blurred vision</b>                       |  |
| Definition                                  | “A disorder characterized by visual perception of unclear or fuzzy images.”  |
| Grades                                      | Grade 1: “Intervention not indicated.”   |
| <b>Bone pain</b>                            |  |
| Definition                                  | “A disorder characterized by a sensation of marked discomfort in the bones.”   |
| Grades                                      | Grade 1: “Mild pain.”  |

**Cont. Table S6. Common Terminology Criteria for Adverse Events (CTCAE) definitions for adverse effects encountered in the current study.**

|                     |   |
|---------------------|---|
| <b>Constipation</b> |   |
| Definition          | “A disorder characterized by irregular and infrequent or difficult evacuation of the bowels.”   |
| Grades              | Grade 1: “Occasional or intermittent symptoms; occasional use of stool softeners, laxatives, dietary modification, or enema.”   |
| <b>Diarrhea</b>     |   |
| Definition          | “A disorder characterized by an increase in frequency and/or loose or watery bowel movements.”  |
| Grades              | Grade 1: “Increase of <4 stools per day over baseline; mild increase in ostomy output compared to baseline.”  |
| <b>Dysuria</b>      |   |
| Definition          | “A disorder characterized by painful urination.”  |
| Grades              | Grade 1: “Present.”   |
| <b>Edema face</b>   |   |
| Definition          | “A disorder characterized by swelling due to excessive fluid accumulation in facial tissues.”   |
| Grades              | Grade 1: “Localized facial edema.”  |
| <b>Edema limbs</b>  |   |
| Definition          | “A disorder characterized by swelling due to excessive fluid accumulation in the upper or lower extremities.”   |
| Grades              | Grade 1: “5 - 10% inter-limb discrepancy in volume or circumference at point of greatest visible difference; swelling or obscuration of anatomic architecture on close inspection.” |

**Cont. Table S6. Common Terminology Criteria for Adverse Events (CTCAE) definitions for adverse effects encountered in the current study.**

|                    |   |
|--------------------|---|
| <b>Headache</b>    |   |
| Definition         | “A disorder characterized by a sensation of marked discomfort in various parts of the head, not confined to the area of distribution of any nerve.”                       |
| Grades             | Grade 1: “Mild pain.”   |
| <b>Myalgia</b>     |   |
| Definition         | “A disorder characterized by marked discomfort sensation originating from a muscle or group of muscles.”  |
| Grades             | Grade 1: “Mild pain.”   |
| <b>Nausea</b>      |   |
| Definition         | “A disorder characterized by a queasy sensation and/or the urge to vomit.”  |
| Grades             | Grade 1: “Loss of appetite without alteration in eating habits.”  |
| <b>Paresthesia</b> |   |
| Definition         | “A disorder characterized by functional disturbances of sensory neurons resulting in abnormal cutaneous sensations of tingling, numbness, pressure, cold, and/or warmth.” |
| Grades             | Grade 1: “Mild symptoms.”   |
| <b>Vomiting</b>    |   |
| Definition         | “A disorder characterized by the reflexive act of ejecting the contents of the stomach through the mouth.”  |
| Grades             | Grade 1: “Intervention not indicated.”  |

**Table S7. Mean adverse effect free time and hazard ratio of developing neuropathy related adverse drug effects among the three groups.**

| <b>Neuropathy<br/>related adverse<br/>effect</b> | <b>Group 1<br/>Mean adverse<br/>effect free time<br/>(months)</b> | <b>Group 2<br/>Mean adverse<br/>effect free time<br/>(months)</b> | <b>Group 3<br/>Mean adverse<br/>effect free time<br/>(months)</b> | <b>Hazard<br/>ratio</b> | <b>95% Confidence<br/>interval of hazard<br/>ratio</b> |
|--|---|---|---|-------------------------|--|
| Constipation                                     | 2.58  | 2.61  | 2.7   | 0.766                   | (0.577-1.018)  |
| Paresthesia                                      | 2.79  | 2.93  | 2.96  | 0.304                   | (0.146-0.631)  |
| Dysuria  | 2.89  | 2.95  | 2.95  | 0.434                   | (0.204-0.932)  |
| Abdominal pain                                   | 2.86  | 2.89  | 2.81  | 1.232                   | (0.758-1.933)  |
| Myalgia  | 2.92  | 2.97  | 3   | 0.347                   | (0.087-1.377)  |
| Blurred vision                                   | 2.98  | 2.97  | 3   | 0.974                   | (0.331-2.863)  |

Mean adverse effect free time was computed using Kaplan Meier analysis, Cox regression analysis was utilized for calculation of hazard ratios with group 3 as the reference group and 95% confidence intervals, adverse effect free time is expressed in months.

**Table S8. Noteworthy drug-drug interactions encountered during the study period.**

| Study group<br>(number of patients)           | Interacting medications   | Risk rating | Mechanism  | Recommendation   |
|---|---|-------------|--|--|
| Group 1: (2)<br>Group 2: (3)<br>Group 3: (2)  | Amphotericin B and Prednisolone                                 | C           | Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B.   | Monitor cardiac function and serum electrolytes (especially potassium) if systemic corticosteroids are co-administered with amphotericin B.  |
| Group 1: (3)<br>Group 2: (5)<br>Group 3: (4)  | Amphotericin B and Vinca alkaloids/Cyclophosphamide/Doxorubicin | C           | Antineoplastic Agents may enhance the adverse/toxic effect of Amphotericin B.  | Monitor for possible increases in renal toxicity, bronchospasm, and hypotension if amphotericin is given concomitantly with antineoplastic agents.   |
| Group 1: (2)<br>Group 2: (4)<br>Group 3: (0)  | Cyclophosphamide and Doxorubicin                                | C           | Cyclophosphamide may enhance the cardiotoxic effect of doxorubicin.  | Monitor cardiac function closely. The cardiotoxic effects of these agents may be additive or synergistic. Administration of cyclophosphamide by infusion or twice daily or using liposomal anthracycline formulations may reduce risk. |
| Group 1: (0)<br>Group 2 : (2)<br>Group 3: (1) | Cyclophosphamide and Hydrochlorothiazide                        | C           | Thiazide Diuretics may enhance the adverse/toxic effect of cyclophosphamide. Specifically, granulocytopenia may be enhanced. | Monitor for signs and symptoms of hematological toxicity.  |

Cont. Table S8. Noteworthy drug-drug interactions encountered during the study period.

| Study group (number of patients)              | Interacting medications |                      | Risk rating | Mechanism  | Recommendation  |
|---|-------------------------|----------------------|-------------|--|---|
| Group 1: (0)<br>Group 2: (26)<br>Group 3: (0) | Diosmin                 | and<br>doxorubicin*  | X*          | P-glycoprotein/ABCB1 Inhibitors may increase the serum concentration of doxorubicin (Conventional).          | Avoid concomitant use of doxorubicin and P-glycoprotein (P-gp) inhibitors.  |
| Group 1: (1)<br>Group 2: (2)<br>Group 3: (1)  | Fluconazole             | and<br>ciprofloxacin | C           | Corticosteroids (Systemic) may enhance the adverse/toxic effect of Quinolones.                               | Monitor patients closely for new-onset tendon or joint pain. The risk may be further increased in older patients (> 60 years) and in recipients of heart, lung, and kidney transplants. |
| Group 1: (1)<br>Group 2: (1)<br>Group 3: (2)  | Fluconazole             | and<br>doxorubicin   | X           | Moderate CYP3A4 Inhibitors (Fluconazole) may increase the serum concentration of doxorubicin (Conventional). | Avoid coadministration of doxorubicin with moderate CYP3A4 inhibitors due to the risk of increased doxorubicin adverse effects.   |

Cont. Table S8. Noteworthy drug-drug interactions encountered during the study period.

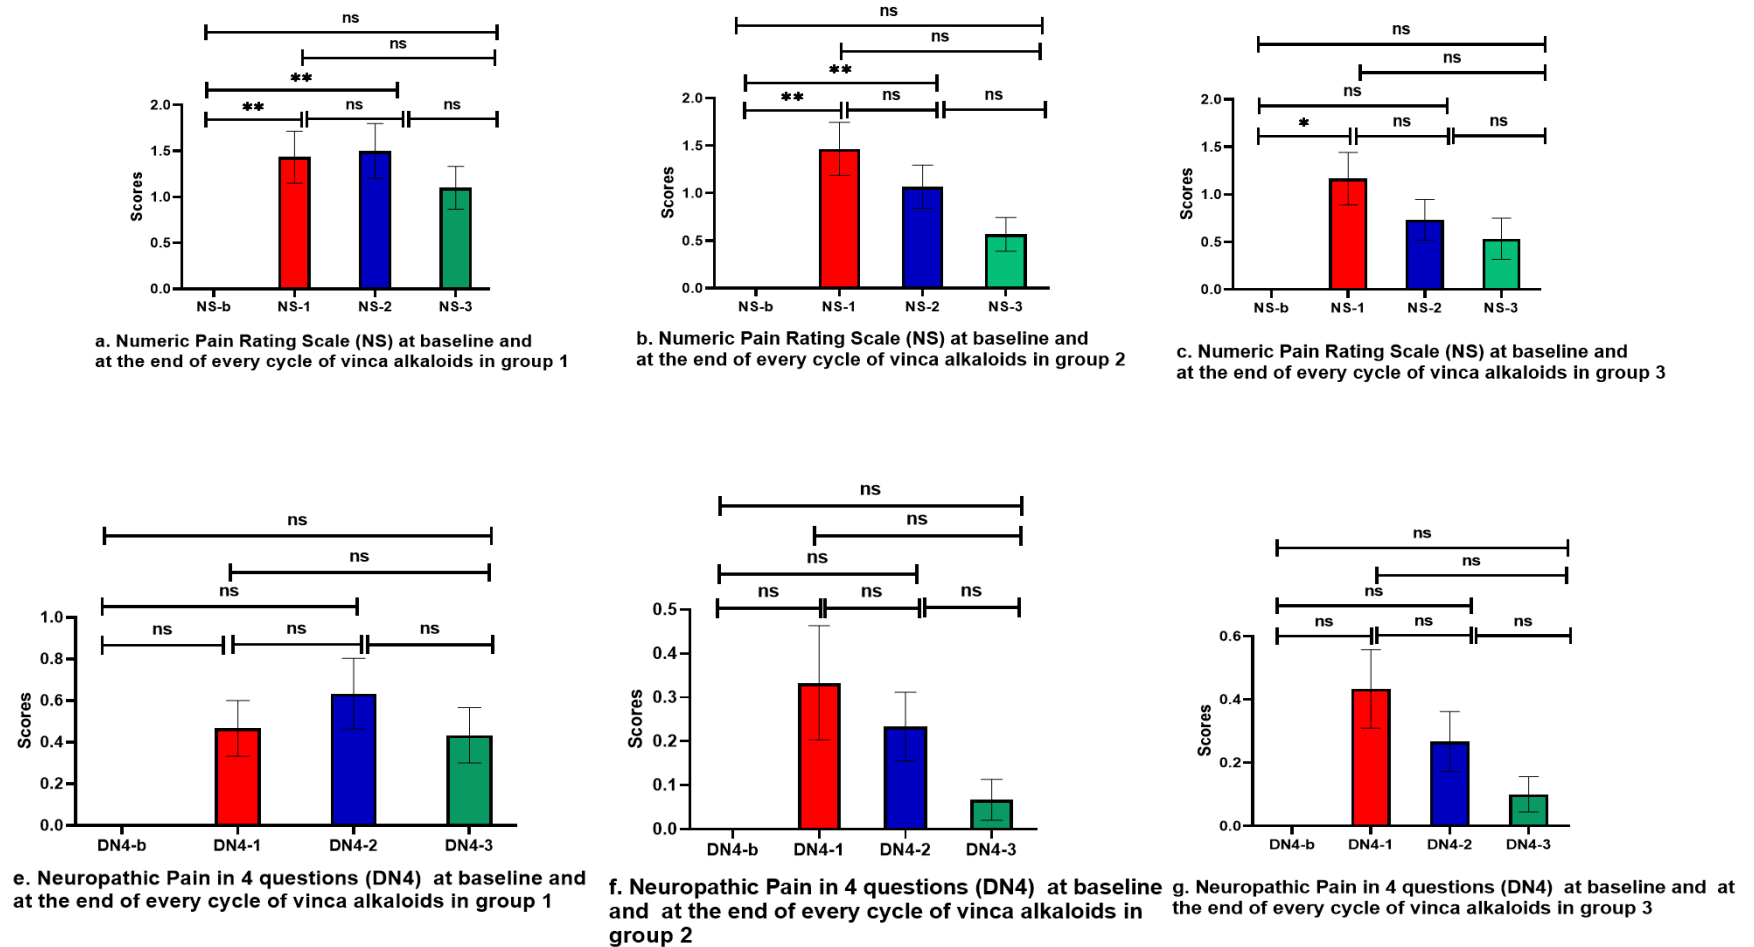

| Study group (number of patients)                | Interacting medications |                     | Risk rating | Mechanism   |           |                                | Recommendation   |
|---|-------------------------|---------------------|-------------|---|-----------|--------------------------------|--|
| Group 1: (22)<br>Group 2: (20)<br>Group 3: (23) | Fluconazole             | and<br>levofloxacin | C           | QT-prolonging (Levofloxacin) may enhance the QTc-prolonging effect of QT-prolonging Inhibitors (Fluconazole).           | Quinolone | Antibiotics<br>Moderate CYP3A4 | Monitor for QTc interval prolongation and ventricular arrhythmias. Patients with other risk factors (eg, older age, female sex, bradycardia, hypokalemia, hypomagnesemia, heart disease, and higher drug concentrations) are likely at greater risk for these potentially life-threatening toxicities. |
| Group 1: (4)<br>Group 2: (3)<br>Group 3: (5)    | Fluconazole             | and<br>ondansetron  | C           | Ondansetron may enhance the QTc-prolonging effect of QT-prolonging Inhibitors (ondansetron)                             |           | Moderate CYP3A4                |  |
| Group 1: (25)<br>Group 2: (26)<br>Group 3: (25) | Fluconazole             | and<br>vincristine  | C           | Fluconazole may increase the serum concentration of vincristine.  |           |                                | Monitor for increased vincristine toxicities.  |
| Group 1: (0)<br>Group 2: (1)<br>Group 3: (1)    | Hydrochlorothiazide     | and<br>prednisolone | C           | Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide and Thiazide-Like Diuretics.                  |           |                                | Monitor serum potassium. The addition of potassium-sparing diuretic and/or potassium supplementation may be necessary with concomitant treatment.  |
| Group 1: (0)<br>Group 2: (0)<br>Group 3: (1)    | Ketoprofen              | and<br>prednisolone | C           | Corticosteroids (Systemic) may enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents (Nonselective) |           |                                | Monitor for signs of bleeding. Concomitant use may increase the risk of gastrointestinal bleeding.   |

**Cont. Table S8. Noteworthy drug-drug interactions encountered during the study period.**

|   |   |                            |   |   |
|---|---|----------------------------|---|---|
| <b>Group 1: (0)</b><br><b>Group 2: (0)</b><br><b>Group 3: (1)</b> | <b>Loratadine</b><br><br><b>hydrochlorothiazide</b> | <b>and</b><br><br><b>C</b> | Anticholinergic Agents (Loratadine) may increase the serum concentration of Thiazide and Thiazide-Like Diuretics. | Monitor for an increased response to thiazide diuretics during concomitant treatment with an anticholinergic agent, particularly when anticholinergic doses are sufficient to reduce gastrointestinal motility. |
| <b>Group 1: (1)</b><br><b>Group 2: (0)</b><br><b>Group 3: (0)</b> | <b>Rifampicin</b><br><br><b>vincristine</b>         | <b>and</b><br><br><b>C</b> | Strong CYP3A4 Inducers (Rifampicin) may decrease the serum concentration of vincristine.                          | Monitor for reduced vincristine efficacy if combined with rifampicin.   |
| <b>Group 1: (1)</b><br><b>Group 2: (2)</b><br><b>Group 3: (2)</b> | <b>Voriconazole</b><br><br><b>prednisolone</b>      | <b>and</b><br><br><b>C</b> | Strong CYP3A4 Inhibitors (voriconazole) may increase the serum concentration of prednisolone.                     | Monitor for increased steroid-related adverse effects.  |
| <b>Group 1: (1)</b><br><b>Group 2: (2)</b><br><b>Group 3: (3)</b> | <b>Voriconazole</b><br><br><b>Vincristine</b>       | <b>and</b><br><br><b>D</b> | Strong CYP3A4 Inhibitors (voriconazole) may increase the serum concentration of vincristine.                      | Seek alternatives to this combination when possible. If combined, monitor closely for vincristine toxicities.   |

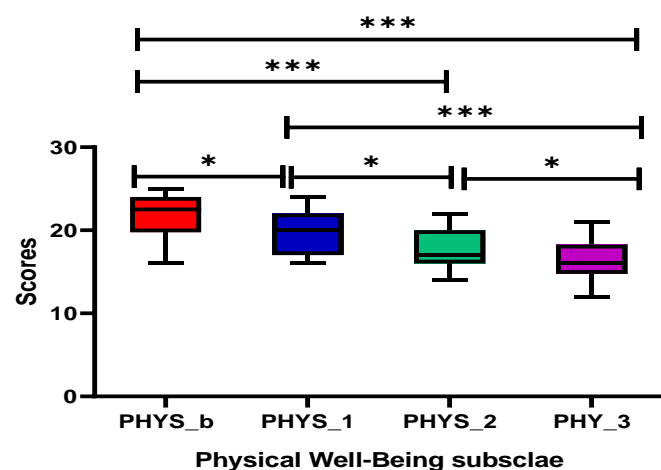

C: Monitor therapy, D: Consider therapy modification, X: Avoid combination. All drug-drug interactions are produced utilizing online Lexicomp® interaction checker last accessed 25<sup>th</sup> May 2023. \*: The interaction recommendation is based on clinical trials of zosuquidar trihydrochloride and cyclosporin interacting with doxorubicin [1,2]. However, diosmin has been evaluated in several studies in which it reduced doxorubicin adverse effects such as nephrotoxicity [3], cardiotoxicity [4] and hepatotoxicity [5,6] and enhanced its antitumor activity[7]
