Abstract: The synthesis of 3-methyl-1,4-diphenyl-7-thioxo-4,6,8,9-tetrahydropyrazolo[5,4-*b*]pyrimidino[5,4-*e*]pyridine-5-one (**6**) was achieved by two different one-pot multi-component synthesis (one-pot three-component and one-pot four component synthesis). Mono and dialkylation of **6** under different conditions gave compounds **7–11**. The hydrazine **12** produced from reaction of **9** with N₂H₄ was subjected to reactions with some aromatic aldehydes, ethyl acetoacetate, acetyl acetone, ethyl cyanoacetate and triethyl orthoformate to give **13–17**, respectively. Compound **12** upon reaction with CS₂, nitrous acid, benzoin, chloroacetone and phenacyl bromide gave **18,20,21,22**. Alkylation of **18** with ethyl iodide, ethyl chloroacetate and phenacyl bromide gave **19a–c**. The antibacterial and antifungal activities of selected derivatives were evaluated.

1. Introduction

Multicomponent domino reactions (MDRs), particularly those performed in aqueous media, have become an increasingly useful tool for the synthesis of chemically and biologically important compounds because of their convergence, atom economy, and other suitable characteristics from the point of view of green chemistry [1–10]. Pyrazoles are excellent precursors for the synthesis of condensed polyfunctionally substituted heterocycles [11–16]. Pyrazolo-annulated heterocycles such as

pyrazolopyridopyrimidines have attracted considerable interest because their derivatives display a wide range of pharmacological activities, e.g., as anticonvulsants [17], antiproliferative agents [18], anti-inflammatories and analgesic agents [19]. In addition these types of compounds are inhibitors of cyclic guanosine-3',5'-monophosphate phosphodiesterase (cGMP PDE), and are thereby agents against erectile dysfunction [20]. They also show miscellaneous biological properties such as virucidal, anticancer, fungicidal, bactericidal and vasodilatory activities [21]. For all the benefits mentioned above and as part of our program investigating syntheses using pyrazole and fused pyrazoles that have biological importance [22–33], we report herein the synthesis of pyrazolo[5,4-*b*]pyrimidino[5,4-*e*]pyridinethiones in a one-pot four component environmental friendly method in light of recently reported methods [34–37].

2. Results and Discussion

2.1. Chemistry

We first describe a comparison between two methods for the construction of pyrazolo[5,4-*b*]pyrimidino[5,4-*e*]pyridin-5-one (**6**), a one-pot four-component domino reaction of phenyl hydrazine (**1**), 3-aminocrotononitrile (**2**), benzaldehyde (**3**) and thiobarbituric acid (**4**) in water in the presence of one equivalent of *p*-toluenesulfonic acid (*p*-TSA) (Method A) and the three-component reaction method involving 5-amino-3-methyl-1-phenylpyrazole (**5**), benzaldehyde (**3**) and thiobarbituric acid (**4**) in presence of *p*-TSA under solvent-free conditions [35] (Method B).

The one-pot four-component method A showed some crucial advantages, such as short reaction time, excellent yield and high purity, which makes it more efficient and broadly applicable. The percentage yield and the reaction time of the one-pot four-components method in comparison with the one-pot three-component one to produce compound **6** was found to be 91/66% and 1 h/10 h, respectively (Scheme 1).

Scheme 1. Synthetic pathways for compound **6**.

The plausible mechanism for the formation of compound **6** is proposed (Scheme 2) and it is in agreement with that proposed in the literature [38]. The domino sequence of reactions is presumably triggered by the formation of 5-amino-3-methyl-1-phenylpyrazole (**5**) from the acid-catalyzed reaction of phenylhydrazine (**1**) with 3-aminocrotononitrile (**2**). The readily formed **5** reacts *in situ* with benzaldehyde to afford intermediate **A**. The later reacted with thiobarbituric acid under the acidic conditions to presumably furnish the intermediate **B**, which subsequently undergoes annulations leading to the final intermediate **C**. This final intermediate gave compound **6** upon losing a molecule of water.

Scheme 2. Mechanistic pathways for the formation of compound **6**.

The structural features of compound **6** were elucidated from its spectral and analytical data. Thus, the IR spectrum revealed absorption bands at 3310, 3290, 3240, 1690, 1345 cm^{-1} characteristic for three NH, C=O and C=S groups, respectively. The $^1\text{H-NMR}$ ($\text{DMSO-}d_6$) displayed three NH singlets (exchangeable with D_2O) at 13.8, 12.2 and 9.4 ppm. A characteristic singlet peak for the pyridine CH-4 appeared at 5.57 ppm. Several alkylated derivatives were obtained from the versatile compound **6**. Thus, upon treatment of **6** with ethyl iodide, ethyl chloroacetate, phenacyl bromide, chloroacetone, chloroacetamide and chloroacetonitrile in the presence of anhydrous sodium acetate in refluxing ethanol, the S-alkylated derivatives **7a–f** were obtained. The IR spectral data of compounds **7a–f** displayed no absorption band for C=S and showed bands at 1280–1345 cm^{-1} confirming the S-alkylation, as well as, compounds **7b–e** revealed absorption bands for C=O at 1690–1735 cm^{-1} . A characteristic absorption band at 2240 cm^{-1} has been observed for CN, confirming the structure of **7f**. Regioselective dialkylation reactions of compound **6** using two equivalent of ethyl iodide indicate that, in the introduction of the second ethyl group into the pyrimidine ring there is a competition between N1 or N3 and revealed that it depends on the base conditions used in the reactions. Thus, refluxing in ethanolic NaOH for 4 h (Method A) afforded the two isomeric compounds **8** and **9** in 63% and 25% yield, respectively, whereas treatment of **6** with two equivalents of ethyl iodide in DMF in the presence of anhydrous K_2CO_3 at room temperature (Method B) afforded in high yield the isomer **9** and only traces of the isomer **8** (Scheme 2). The reaction was monitored by TLC. The reaction mixture was

chromatographically work up over silica gel using Pet. ether (b.p. 60–80 °C) and ethyl acetate (1:1) as eluent, to afford two products in pure form. A crystalline solid, m.p. 162–164 °C obtained in the first fraction was characterized as 6-ethyl-7-ethylthio-3-methyl-1,4-diphenyl-4,6,9-trihydropyrazolo[5,4-*b*]pyrimidino[5,4-*e*]pyridine-5-one (**9**). The second fraction afforded a solid, m.p. 190–192 °C, which was identified as 8-ethyl-7-ethylthio-3-methyl-1,4-diphenyl-4,6,9-trihydropyrazolo[5,4-*b*]pyrimidino[5,4-*e*]pyridine-5-one (**8**). By TLC comparison, data analysis and melting point determination, it was found that one of the products **9** was identical to that obtained from Method B. The chemical shift for the pyrimidinone carbonyl is markedly affected by the nature of the adjacent nitrogen [39–43]. The ^{13}C -NMR spectral data of compound **9** showed that the δ values of the pyrimidine C=O at 165.82 ppm suggest that N-3 near to C=O is sp^3 -hybridized (pyrrole type) and different from the C=O adjacent to a sp^2 -hybridized nitrogen (pyridine type) in compound **8**, which appears at 178.14 ppm [42,43]. Moreover, reaction of **6** with highly electron withdrawing aromatic halo compounds such as 2,4-dinitrochlorobenzene in DMF at room temperature yielded the S-aryl derivative **10**, whereas, upon heating, benzothiazolo derivative **11** was obtained *via* ring closure reaction with the N3-pyrimidine ring [44]. As chemical evidence, the formation of compound **11** was achieved through heating of a sample of **10** in DMF. The structures of **10** and **11** were deduced from their satisfactory spectral and analytical data, for example, the mass spectrum of compound **11** showed its correct parent ion peak at m/z 506 (M^+ , 100%) (Scheme 3).

Scheme 3. Synthetic pathways for compounds **7a–f**, **8**, **9**, **10** and **11**.

The sulfur-free compound **12**, which was identified as 6-ethyl-7-hydrazino-3-methyl-1,4-diphenyl-4,6,9-trihydropyrazolo[5,4-*b*]pyrimidino[5,4-*e*]pyridine-5-one, was obtained in excellent yield (85%) *via* nucleophilic displacement of the thioethyl group in compound **9** with hydrazine in boiling ethanol (Scheme 4).

Scheme 4. Synthetic pathways for compounds 12–17.

The hydrazine derivative **12** was used as the key intermediate for the synthesis of some polyheterocyclic compounds. Thus, heating of compound **12** with some aromatic aldehydes namely, benzaldehyde, 4-chlorobenzaldehyde and 4-methoxybenzaldehyde in the presence of a few drops of acetic acid in ethanol resulted in the formation of the corresponding hydrazones **13a–c**. The structure of compounds **13a–c** was characterized by the disappearance of the NHNH_2 group and revealed in each case two bands at 3425–3250 and 3170–3100 cm^{-1} assignable to two NH groups. Also, their ^1H -NMR spectra showed the presence of the azomethine and two NH protons at 8.9–9.5 and 10.85–12.75 ppm, respectively. On the other hand, upon heating the hydrazino compound **12** with ethyl acetoacetate, acetylacetone and ethyl cyanoacetate in ethanolic sodium ethoxide solution, the *N*-pyrazolo derivatives **14–16** were produced. For example, the ^1H -NMR spectrum for compound **15** revealed a singlet at 6.15 ppm due to the 4-*H*-pyrazole moiety. The ^{13}C -NMR spectral data displayed two characteristic singlets at 151.12 and 152.5 ppm for C3 and C5 of the pyrazole nucleus, respectively, which was in agreement with the literature value [45]. The formation of the tetracyclic pyrazolo[5,4-*b*]1,2,4-triazolo[4',3'-2,1]pyrimidino[5,6-*e*]pyridine (**17**) was achieved upon reaction of **12** with triethyl orthoformate in ethanol in presence of a few drops of acetic acid (Scheme 4). The ^1H -NMR spectrum of compound **17** revealed the disappearance of NHNH_2 signals and appearance of a singlet signal at 8.55 ppm due to the triazole CH.

Furthermore, the interaction of the hydrazine **12** with CS₂ in pyridine furnished the angular tetracyclic pyrazolo[5,4-*b*]1,2,4-triazolo[4',3'-2,1]pyrimidino[5,6-*e*]pyridin-3(2*H*)-thione (**18**) in good yield (Scheme 5).

Scheme 5. Synthetic pathways for compounds 18–22a,b.

The thione **18** was easily converted into a series of S-alkylated derivatives **19a–c** upon treatment with ethyl iodide, ethyl chloroacetate and phenacyl bromide in the presence of anhydrous sodium acetate in refluxing ethanol, respectively. As well, the reaction of **11** with sodium nitrite in acetic acid at 0 °C, led to the formation of the pyrazolotetrazolopyrimidinopyridine **20** in 75% yield. This new ring system is in equilibrium with the corresponding 2-azido tautomer **20'** [46], which was confirmed by a characteristic absorption peak of the azido group at 2250 cm^{-1} in the IR. The tetracyclic pyrazolotriazinopyrimidinopyridine compounds **21** and **22a,b** were obtained in good to high yield when compound **12** was allowed to react with benzoin in acetic anhydride- pyridine mixture and/or with some α -haloketones (chloroacetone and phenacyl bromide) in DMF/AcOH, respectively (Scheme 5). The structures of compounds **21** and **22a,b** were confirmed by spectral data. For example, the ^1H -NMR spectrum of compound **22b** revealed a singlet at 9.3 due to CH-triazine and displayed two broad singlets (D_2O -exchangable) at 10.75 and 11.25 due to NH groups. The mass spectra of compound **22b** showed its correct parent ion peak at m/z 513 (M^+ , 100%).

2.2. Biological Results

Using the agar well-diffusion method [47], ten selected derivatives (compounds **6**, **7a**, **9**, **11**, **12**, **13b**, **17**, **19c**, **20**, and **22a**) were evaluated for their antibacterial and antifungal activities. Thus, these compounds were screened against *Staphylococcus aureus*, *Bacillus cereus*, *Micrococcus luteus* as a Gram positive bacteria and *Escherichia coli*, *Pseudomonas aeruginosa* and *Serratia marcescens* as Gram negative bacteria using chloramphenicol as control (Table 1). The MIC results indicated that three of the tested compounds (**11**, **19** and **22a**) showed significant activity against *Staphylococcus aureus* (Table 1). Compounds **12** and **19c** showed highly significant activity against *Bacillus cereus* and moderate activity against *Micrococcus luteus* (Table 1). Compound **22a** revealed moderate activity against *Staphylococcus aureus* and *Pseudomonas aeruginosa* (Table 1). The rest of tested compounds were inactive against all bacterial strains used.

3. Experimental

3.1. General

All melting points were determined on a Kofler melting point apparatus. IR spectra were recorded on a Pye Unicam SP3-100 spectrophotometer using the KBr wafer technique. The ^1H -NMR spectra were recorded on a Bruker ARX 200 spectrometer (200 MHz for ^1H and 50 MHz for ^{13}C) at the Faculty of Science, University of King Saoud, Saudi Arabia, Riyadh and on a Jeol LA 400 MHz (400 MHz for ^1H , 100 MHz for the ^{13}C) at Assiut University, ^1H and ^{13}C NMR chemical shifts (δ) were reported in parts per million (ppm) and were referenced to the solvent peak; CDCl_3 (7.26 ppm for ^1H and 76.90 ppm for ^{13}C) and $\text{DMSO}-d_6$ (2.50 ppm for ^1H and 39.70 ppm for ^{13}C). Multiplicities are represented by s (singlet), d (doublet), t (triplet), q (quartet) and m (multiplet). Coupling constants (J) are reported in Hertz (Hz). Mass spectra were taken on a JEOL JMS600 spectrometer at an ionizing potential of 70 eV (EI) at Assiut University. Elemental analyses were carried out using a Perkin-Elmer 240 C Micro analyzer at Assiut University and they were found to be within $\pm 0.4\%$ of the theoretical values.

3.2. Synthesis of 3-Methyl-1,4-diphenyl-7-thioxo-4,6,8,9-tetrahydropyrazolo[5,4-b]pyrimidino[5,4-e]pyridin-5-one (6)

Method A: A mixture of thiobarbituric acid (1.44 g, 0.01 mol), 3-methyl-1-phenyl-1H-pyrazol-5-amine (1.73 g, 0.01 mol), benzaldehyde (1.1 g, 0.012 mol) and *p*-TSA (1 g, 0.05 mol) was heated at 100 °C for 10 h (monitored by TLC). After cooling, the reaction mixture was washed with water (20 mL) and residue recrystallized from EtOH to afford the pure product **6** as a yellow powder. Yield: 66%. Mp 202–204 °C. IR (KBr) cm^{-1} : 3240, 3290, 3310 (3NH), 1690 (C=O), 1620 (C=N), 1345 (C=S). ^1H -NMR ($\text{DMSO}-d_6$): 2.75 (s, 3H, CH_3), 5.57 (s, 1H, CH pyridine), 7.25–7.98 (m, 10H, Ar-H), 9.45

Method B: A mixture of phenylhydrazine (1 mmol), 3-aminocrotononitrile (1mmol) and *p*-TSA (0.5 mmol) in water (10 mL) was added to benzaldehyde (1 mmol) and thiobarbituric acid (1 mmol) and the reaction mixture was heated under reflux at 100 °C for 1 h, after completion of the reaction (TLC), the reaction mixture cooled to room temperature, the precipitate filtered off and washed with water and recrystallized from EtOH to afford the pure product **6** as a yellow powder. Yield: 91%. All of spectral and physical data were in agreement with that described in method A.

3.3. General Procedure for the Preparation of **7a–f**

A mixture of **6** (3.8 g, 0.01 mol), ethyl iodide and/or α -haloketone compound (0.01 mol) in ethanol (50 mL) was refluxed in the presence of anhydrous sodium acetate (0.9 g, 0.011 mol) for 4 h. The solid product separated from the hot mixture was filtered off, washed with water and recrystallized from the proper solvent.

3.18. Antimicrobial Activity

The antimicrobial activity of 10 new chemical compounds was tested *in vitro* against six bacterial species obtained from contaminated soil, water and food substances (*Staphylococcus aureus* [AUMC No. B-54], *Bacillus cereus* [AUMC No. B-52], *Micrococcus luteus* (+ve) [AUMC NoB-112], *Escherichia coli* [AUMC No. B-53], *Pseudomonas aeruginosa* [AUMC No. B-73] and *Serratia marcescens* [AUMC No. B-55]. They were also tested against six fungal species which are involved in human and animal diseases (*Trichophyton rubrum* [AUMC No. 1804], *Candida albicans* [AUMC No. 418], *Geotrichum candidum* [AUMC No. 226], *Scopulariopsis brevicaulis* [AUMC No. 729] and *Aspergillus flavus* [AUMC No. 3214] or plant diseases (*Fusarium oxysporum* [AUMC No. 5119]. These strains are common contaminants of the environment in Egypt and some of all microbial strains were kindly provided by the Assiut University Mycological Centre (AUMC). To prepare inocula for bioassay, bacterial strains were individually cultured for 48 h in 100 mL conical flasks containing 30 mL nutrient broth medium. Fungi were grown for 7 days in 100 mL conicals containing 30 mL Sabouraud's dextrose broth. Bioassay was done in 10 cm sterile plastic Petri plates in which microbial suspension (1 mL/plate) and 15 mL appropriate agar medium (15 mL/plate) were poured. Nutrient agar and Sabouraud's dextrose agar were respectively used for bacteria and fungi. After solidification of the media, 5 mm diameter cavities were cut in the solidified agar (4 cavities/plate) using sterile cork borer. Chemical compounds dissolved in DMSO at 2%w/v (=20 mg/mL) were pipetted in the cavities

(20 µL/cavity). Cultures were then incubated at 28 °C for 48 h in case of bacteria and up to 7 days in case of fungi. Results were read as the diameter (in mm) of inhibition zone around cavities [29]. To determine the minimum inhibitory concentrations (MICs), chemical compounds giving positive results were diluted with DMSO to prepare a series of descending concentrations down to 0.02 mg/mL. Diluted chemicals were similarly assayed as mentioned before and the least concentration (below which no activity) was recorded as the MIC.

4. Conclusions

In conclusion, we have reported the synthesis of some novel heterocyclic pyrazolo-pyrimidinopyridines and related compounds. Ten of the newly synthesized compounds have been screened for their biological activities against three Gram positive, three Gram negative bacteria, as well as six fungal strains. Most of the tested compounds showed activities against the strains used. Compound **19c** proved to be the most potent compound of all those used.
