#### Abstract

A library of 24 6-(5-oxo-1-phenylpyrrolidin-3-yl)pyrimidine-5-carboxamides $\mathbf{1 0}\{1,2 ; 1-12\}$ was prepared by a parallel solution-phase approach. The synthesis comprises a five-step transformation of itaconic acid (11) into 1-methyl and 1-phenyl substituted 6-(5-oxo-1-phenylpyrrolidin-3-yl)pyrimidine-5-carboxylic acids $\mathbf{1 7}\{1,2\}$ followed by parallel amidation of $\mathbf{1 7}\{1,2\}$ with a series of 12 aliphatic amines $\mathbf{1 8}\{1-12\}$ to afford the corresponding carboxamides $\mathbf{1 0}$ in good overall yields and in $80-100 \%$ purity.

## 1. Introduction

2-[(Hetero)aryl]ethylamines, such as dopamine, histamine, tryptamine, serotonin, and melatonin are representative chemical messengers playing a crucial role in biological processes [1]. Therefore, the preparation of libraries of their novel synthetic analogues is of particular interest and represents an important target in medicinal [2-5], synthetic organic, and combinatorial chemistry [6-10].

In the last two decades, alkyl 2-substituted 3-(dimethylamino)prop-2-enoates and related enaminones have proven to be easily available and versatile reagents for the preparation of various functionalized heterocycles [11-15]. Recently, a part of our research in this field has been focused on the synthesis of aminoethyl functionalized heterocycles. In this context, we first reported the synthesis
of non-racemic 1-heteroaryl-2-phenylethylamines $\mathbf{1 - 3}$ from $\alpha$-amino acid derived enaminoketones [16]. Further, the syntheses of the pyrazole analogues of histamine were developed: 2-aminoethyl substituted 1 H -pyrazole derivatives $\mathbf{4 - 6}$ as the open-chain analogues [17-20] and 6,7-dihydro- 1 H -pyrazolo[4,3-c]pyridin- $4(5 \mathrm{H})$-one derivatives 7 [21], 5-(2-aminophenyl)pyrazole derivatives $\mathbf{8}$ [22], and 5-(5-oxo-1-phenylpyrrolidin-3-yl)-1H-pyrazole-4-carboxamides 9 [23] as the conformationally constrained analogues of histamine. In continuation, we have focused our attention on 2-substituted 6-(5-oxo-1-phenylpyrrolidin-3-yl)pyrimidine-5-carboxamides 10 (Figure 1).

Herein, we report a parallel solution-phase synthesis of a library of 24 6-(5-oxo-1-phenylpyrrolidin3 -yl)pyrimidine-5-carboxamides $\mathbf{1 0}\{1,2 ; 1-12\}$ as novel 2-heteroarylethylamine derivatives.

## 2. Results and Discussion

### 2.1. Synthesis of Title Compounds $\mathbf{1 0}$

First, the starting compound $\mathbf{1 2}$ was prepared from commercially available itaconic acid (11) and aniline following the literature procedure [24]. Transformation of $\mathbf{1 2}$ into the enaminone $\mathbf{1 4}$ as the first key intermediate was performed following the literature protocol [23]: Masamune-Claisen condensation of $\mathbf{1 2}$ with 1,1'-carbonyldiimidazole (CDI) as activating agent in anhydrous acetonitrile at room temperature gave the $\beta$-keto ester 13, which when treated with $N, N$-dimethylformamide dimethylacetal (DMFDMA) in refluxing toluene gave the enaminone intermediate 14. Subsequent cyclisation of $\mathbf{1 4}$ with acetamidine $\mathbf{1 5}\{1\}$ and benzamidine $\mathbf{1 5}\{2\}$ afforded methyl 4-(5-oxo-1-phenylpyrrolidin-3-yl)pyrimidine-5-carboxylates $\mathbf{1 6}\{1\}$ and $\mathbf{1 6}\{2\}$ in $50 \%$ and $65 \%$ yield, respectively. Finally, hydrolysis of $\mathbf{1 6}\{1\}$ and $\mathbf{1 6}\{2\}$ with 1 M aqueous NaOH in a mixture of
methanol and THF at room temperature furnished the corresponding carboxylic acids $\mathbf{1 7}\{1\}$ and $\mathbf{1 7}\{2\}$ in $86 \%$ and $92 \%$ yield, respectively (Scheme 1).

Scheme 1. Synthesis of 4-(5-Oxo-1-phenylpyrrolidin-3-yl)pyrimidine-5-carboxylic Acids $17\{1,2\}$.

With the desired carboxylic acids $\mathbf{1 7}\{1,2\}$ as the key-intermediates in our hands, a parallel solution-phase synthesis of 2-substituted 6-(5-oxo-1-phenylpyrrolidin-3-yl)pyrimidine-5-carboxamides 10 was studied. We supposed that the reaction conditions for the parallel amidation step as well as the workup protocol should be similar to those employed in the synthesis of closely related pyrazole analogues 9 [23]. Accordingly, bis(pentafluorophenyl) carbonate BPC was chosen as the reagent for activation of the carboxylic acids $\mathbf{1 7}$ and acetonitrile as the solvent. Preliminary amidations of $\mathbf{1 7}\{1,2\}$ with benzylamine ( $\mathbf{1 8}\{3\}$ ) as the model primary amine proceeded smoothly to furnish the desired $N$-benzylcarboxamides $\mathbf{1 7}\{1 ; 3\}$ and $\mathbf{1 7}\{2 ; 3\}$, which precipitated from the reaction mixtures and were isolated by filtration. Somewhat surprisingly, analogous amidations of $\mathbf{1 7}\{1,2\}$ with diethylamine ( $\mathbf{1 8}\{8\}$ ) did not proceed to completion unless excess diethylamine ( $\mathbf{1 8}\{8\}$ ) was employed. The corresponding carboxamides $\mathbf{1 7}\{1 ; 8\}$ and $\mathbf{1 7}\{2 ; 8\}$ did not precipitate from the reaction mixtures and were isolated by evaporation of the reaction mixtures followed by purification by dry flash column chromatography (DFCC) [25,26] over aluminium oxide [27]. Consequently, the following procedure for parallel amidation was applied: the acids $17\{1,2\}$ were activated with triethylamine and bis(pentafluorophenyl) carbonate (BPC) in acetonitrile at room temperature to give the intermediate pentafluorophenyl esters $\mathbf{1 9}\{1,2\}$, which were subsequently treated with 1 equiv. of primary amines $\mathbf{1 8}\{1-7\}$ or with 10 equiv. of secondary amines $\mathbf{1 8}\{8-12\}$ at room temperature for 12 h . Nine products that precipitated from the reaction mixtures were isolated by filtration to afford carboxamides $\mathbf{1 0}\{1 ; 3,4\}$ and $\mathbf{1 0}\{2 ; 1-7\}$ in $28-100 \%$ yields and in $84-100 \%$ purity (Workup A). The rest of the products, which did not precipitate from the reaction mixtures, were isolated by evaporation of the
reaction mixtures followed by purification of the residues by DFCC over aluminium oxide, and evaporation of the eluates to give compounds $\mathbf{1 0}\{1 ; 1,2,5-12\}$ and $\mathbf{1 0}\{2 ; 8-12\}$ in $40-100 \%$ yields and in $80-100 \%$ purity (Workup B). In this manner, all 24 carboxamides $\mathbf{1 0}\{1,2 ; 1-12\}$ were successfully obtained in $18-100 \%$ yields and in $80-100 \%$ purity. Out of 24 library members, 17 were $\geq 95 \%$ pure and 7 were $\geq 80 \%$ pure (Scheme 2, Table 1).

[a] Workup A: filtration of the reaction mixture; Workup B: evaporation of the reaction mixture, followed by DFCC purification. [b] Determined by LC-MS, ${ }^{1} \mathrm{H}-\mathrm{NMR}$, and ${ }^{13} \mathrm{C}-\mathrm{NMR}$. [c] Confirmed by elemental analysis. The found values for $\mathrm{C}, \mathrm{H}$, and N were within $\pm 0.4 \%$ range with respect to the theoretical values.

### 2.2. Structure Determination

The structures and purities of novel compounds $\mathbf{1 0}\{1,2 ; 1-12\}, \mathbf{1 6}\{1,2\}$, and $\mathbf{1 7}\{1,2\}$ were determined by spectroscopic methods (IR, ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$, MS, HRMS), by LC-MS, and by elemental analyses for $\mathrm{C}, \mathrm{H}$, and N . Spectral and analytical data for novel compounds $\mathbf{1 0}\{1,2 ; 1-12\}$, $\mathbf{1 6}\{1,2\}$, and $\mathbf{1 7}\{1,2\}$ were in agreement with the proposed structures. Correlation of NMR data for compounds $\mathbf{1 0}\{1,2 ; 1-12\}, \mathbf{1 6}\{1,2\}$, and $\mathbf{1 7}\{1,2\}$ revealed very good agreement of chemical shifts and coupling constants for the core nuclei (Table 2).

Since the products $\mathbf{1 0}\{1,2 ; 1-12\}$ were isolated as racemic mixtures [28], we also tried to find suitable conditions for separation of the enantiomers of compounds $\mathbf{1 0}$ by HPLC using analytical chiral stationary phase column Chiralcel ${ }^{\circledR}$ OD-H $(0.46 \mathrm{~cm} \times 25 \mathrm{~cm})$ and $n$-hexane/isopropanol as mobile phase. To our pleasant surprise, all 24 racemic compounds were resolved under these conditions. Most probably, the results obtained on analytical column should be applicable in (semi)preparative separation of enantiomers of $\mathbf{1 0}\{1,2 ; 1-12\}$, while these separation conditions could also serve as a important information for separation of analogous racemic compounds (Table 3).

Finally, some physicochemical properties of compounds $\mathbf{1 0}\{1,2 ; 1-12\}$ were calculated to estimate their drug-likeness. The compounds have molecular weight (MW) between 160 and 500, number of atoms between 20 and $70, \mathrm{CLog} \mathrm{P}$ between -0.4 and 5.6 , number of hydrogen bond donors $(\mathrm{HBD}) \leq 5$, number of hydrogen bond acceptors $(\mathrm{HBA}) \leq 10$, and polar surface area (PSA) bellow $140 \AA^{2}$ [29,30]. These calculated physicochemical properties compliant with Lipinski's rule of five indicate promising drug-likeness of the synthesized compounds $\mathbf{1 0}\{1,2 ; 1-12\}$ (Table 4).

## 3. Experimental

### 3.1. General Methods

Melting points were determined on a Stanford Research Systems MPA100 OptiMelt automated melting point system (Sunnyvale, CA, USA). The NMR spectra were obtained on a Bruker Avance III UltraShield 500 plus (Karlsruhe, Germany) at 500 MHz for ${ }^{1} \mathrm{H}$ and 126 MHz for the ${ }^{13} \mathrm{C}$ nucleus, using DMSO- $\mathrm{d}_{6}$ and $\mathrm{CDCl}_{3}$ with TMS as the internal standard, as solvents. Mass spectra were recorded on a Agilent 6224 Accurate Mass TOF LC/MS spectrometer (Santa Clara, CA, USA), IR spectra on a Perkin-Elmer Spectrum BX FTIR spectrophotometer (Waltham, MA, USA). Microanalyses were performed on a Perkin-Elmer CHN Analyzer 2400 II (Waltham, MA, USA). Drying of the compounds 10 and 17 was performed in a Büchi drying oven (Flawil, Switzerland). Dry flash column chromatography (DFCC) was performed on Aluminium Oxide Fluka for Chromatography, cat. \# 06310 , type 506 C weakly acidic, $0.05-0.15 \mathrm{~mm}, \mathrm{pH} 6.0 \pm 0.5$ (Buchs, Switzerland).

For LC-MS/MS experiments, liquid chromatograph Perkin Elmer Series 200 from Perkin Elmer (Shelton, CT, USA) with UV detector and 3200 QTRAP LC/MS/MS System equipped with ESI and APCI ion sources from Applied Biosystems/MDS Sciex (Foster City, CA, USA) were used. HPLC column was Gemini, dimensions $150 \mathrm{~mm} \times 4.6 \mathrm{~mm}, 3 \mu \mathrm{~m}$ particles from Phenomenex (Torrance, CA, USA). Mobile phase was a gradient of acetonitrile (A) and deionised water (B): $0 \mathrm{~min}-10 \% \mathrm{~A}$, $25 \mathrm{~min}-100 \%$ A, 3 min equilibration time with initial mobile phase ( $10 \% \mathrm{~A}$ ) was allowed for column equilibration. Mobile phase flow was $1 \mathrm{~mL} / \mathrm{min}$. Injection volume was $20 \mu \mathrm{~L}$. Signal was recorded using UV detector at 254 nm and mass spectra were recorded using positive (ESI + ) and negative (ESI-) ionization mode simultaneously. Mass range was from 70 to 500 amu . Electrospray ion source (ESI) conditions were as follows: cone voltage 5500 V (ESI + ) and -4500 V (ESI-), respectively, ion source temperature $4,000{ }^{\circ} \mathrm{C}$, curtain gas $\mathrm{N}_{2}$ pressure was set to 10 psi, nebulizer gas $\mathrm{N}_{2}$ pressure was set to 20 psi and turbo gas (air) pressure was set to 40 psi . Declustering potential 30 V and entrance potential 10 V was used, respectively.

Itaconic acid (11), 1,1'-carbonyldiimidazole, $N, N$-dimethylformamide dimethylacetal (DMFDMA), acetamidine hydrochloride $\mathbf{1 5}\{1\}$, benzamidine $\mathbf{1 5}\{2\}$, bis(pentafluorophenyl) carbonate (BPC), and amines $\mathbf{1 8}\{1-12\}$ are commercially available (Sigma-Aldrich). 5-Oxo-1-phenylpyrrolidin-3-carboxylic acid (12) [24] and methyl 3-oxo-3-(5-oxo-1-phenylpyrrolidin-3-yl)propanoate (13) [23] were prepared according to the literature procedures.

Parallel stirring and filtrations were carried out on Mettler-Toledo Bohdan MiniBlock ${ }^{\mathrm{TM}}$ Compact Shaking and Washing Station and Vacuum Collection Base ( $2 \times 12$ positions, Vortex stirring, 400 r.p.m. in all cases). Parallel evaporations were carried out on Büchi Syncore ${ }^{\circledR}$ Polyvap parallel evaporator ( 24 positions, Vortex stirring, 400 r.p.m. in all cases). Parallel drying was carried out on Hettlab IR-Dancer Infra-Red Vortex-Evaporator (42 positions, Vortex stirring, 400 r.p.m. in all cases).

### 3.2. Synthesis of Methyl 3-(Dimethylamino)-2-(5-oxo-1-phenylpyrrolidine-3-carbonyl)acrylate (14)

This compound was prepared according to a slightly modified literature procedure [23]. A mixture of $\beta$-keto ester $\mathbf{1 3}$ [23] ( $5.2 \mathrm{~g}, 20 \mathrm{mmol}$ ), anhydrous toluene ( 20 mL ), and DMFDMA ( $2.8 \mathrm{~g}, 3 \mathrm{~mL}$,

20 mmol ) was stirred at $60^{\circ} \mathrm{C}$ for 3 h . Volatile components were evaporated in vacuo to give the crude 14 as a yellow oil in quantitative yield.

### 3.3. Synthesis of Methyl 2-Methyl-6-(5-Oxo-1-phenylpyrrolidin-3-yl)pyrimidine-5-carboxylate (16\{1\})

Cold $\left(0^{\circ} \mathrm{C}\right)$ solution of $t$-BuOK ( $2.3 \mathrm{~g}, 20 \mathrm{mmol}$ ) in anhydrous methanol ( 20 mL ) was added to a cold $\left(0^{\circ} \mathrm{C}\right)$ solution of acetamidine hydrochloride $(\mathbf{1 5}\{1\}, 1.9 \mathrm{~g}, 20 \mathrm{mmol})$ in methanol $(20 \mathrm{~mL})$ and the mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 5 min . The suspension was filtered with suction through a fritted funnel and the precipitated KCl was washed with anhydrous methanol $(2 \times 10 \mathrm{~mL})$ to afford a solution of the free acetamidine $\mathbf{1 5}\{1\}$ ( 20 mmol ) in methanol. This was added to a solution of the crude enaminone $13(20 \mathrm{mmol})$ in methanol $(100 \mathrm{~mL})$ and the mixture was stirred at room temperature for 18 h . The precipitate was collected by filtration, and washed with methanol $(2 \times 10 \mathrm{~mL})$ to give $\mathbf{1 6}\{1\}$. Yield: $3.2 \mathrm{~g}(50 \%)$ of white solid; m.p. $131-133{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(500 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d}_{6}\right): \delta 2.77(3 \mathrm{H}, \mathrm{s}$, $\left.2-\mathrm{CH}_{3}\right) ; 2.96\left(1 \mathrm{H}, \mathrm{dd}, J=9.1,16.9 \mathrm{~Hz}, 4{ }^{\prime}-\mathrm{Ha}\right) ; 3.17\left(1 \mathrm{H}, \mathrm{dd}, J=7.3,16.9 \mathrm{~Hz}, 4^{\prime}-\mathrm{Hb}\right) ; 3.97$ ( $3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right) ; 4.15\left(1 \mathrm{H}, \mathrm{dd}, J=6.4,9.6 \mathrm{~Hz}, 2^{\prime}-\mathrm{Ha}\right) ; 4.24\left(1 \mathrm{H}, \mathrm{dd}, J=8.4,9.5 \mathrm{~Hz}, 2^{\prime}-\mathrm{Hb}\right) ; 4.70(1 \mathrm{H}$, quintet, $\left.J=8.3 \mathrm{~Hz}, 3^{\prime}-\mathrm{H}\right) ; 7.14(1 \mathrm{H}, \mathrm{br} \mathrm{t}, J=7.4 \mathrm{~Hz}, p-\mathrm{Ph}) ; 7.37(2 \mathrm{H}, \mathrm{br} \mathrm{t}, J=8.0 \mathrm{~Hz}, o-\mathrm{Ph}) ; 7.63(2 \mathrm{H}, \mathrm{br} \mathrm{d}$, $J=7.9 \mathrm{~Hz}, m-\mathrm{Ph}) ; 9.06(1 \mathrm{H}, \mathrm{s}, 4-\mathrm{H}) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 26.5,35.5,38.0,52.9,53.3$, $120.1,120.3,124.8,129.0,139.3,159.5,165.2,170.1,171.2,172.7 . \mathrm{LC}-\mathrm{MS}: \mathrm{R}_{t}=13.217 \mathrm{~min}$, $m / z=312\left(\mathrm{MH}^{+}\right)$, area $\%=80 . m / z$ (HRMS) Found: 312.1345 $\left(\mathrm{MH}^{+}\right) . \mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{3} \mathrm{O}_{3}$ requires: $m / z=312.1343$. ### 3.4. Synthesis of Methyl 6-(5-Oxo-1-phenylpyrrolidin-3-yl)-2-phenylpyrimidine-5-carboxylate (16\{2\})

Benzamidine $\mathbf{1 5}\{2\}(2.4 \mathrm{~g}, 20 \mathrm{mmol})$ was added to a solution of the crude enaminone $\mathbf{1 4}$ ( 20 mmol ) in anhydrous methanol $(100 \mathrm{~mL})$ and the mixture was stirred at room temperature for 72 h . The precipitate was collected by filtration, and washed with methanol $(2 \times 30 \mathrm{~mL})$ to give $\mathbf{1 6}\{2\}$. ### 3.5. Synthesis of 2-Methyl-6-(5-oxo-1-phenylpyrrolidin-3-yl)pyrimidine-5-carboxylic Acid (17\{1\})

A mixture of the ester $\mathbf{1 6}(13 \mathrm{mmol}), 1 \mathrm{M}$ aqueous $\mathrm{NaOH}(30 \mathrm{~mL})$, methanol ( 30 mL ), and THF $(30 \mathrm{~mL})$ was stirred at room temperature for 5 h . Methanol and THF were removed by evaporation
in vacuo ( $35^{\circ} \mathrm{C}, 100 \mathrm{mbar}$ ), the aqueous residue was acidified with concentrated hydrochloric acid to $\mathrm{pH} \sim 1$, and the product was extracted with dichloromethane $(4 \times 200 \mathrm{~mL})$. The combined organic phases were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and the filtrate was evaporated in vacuo to give $\mathbf{1 7}\{1\}$. 3.7. Parallel Synthesis of 2-Substituted 6-(5-Oxo-1-phenylpyrrolidin-3-yl)pyrimidine-5-carboxamides $10\{1,2 ; 1-12\}$

Two MiniBlocks ${ }^{\mathrm{TM}}$ were equipped with 12 fritted vessels each and mounted on a compact stirring and washing station. The reaction vessels were charged with carboxylic acids $\mathbf{1 7}\{1\}(12 \times 149 \mathrm{mg}$, $12 \times 0.5 \mathrm{mmol})$ and $\mathbf{1 7}\{2\}(12 \times 180 \mathrm{mg}, 12 \times 0.5 \mathrm{mmol})$, anhydrous acetonitrile $(24 \times 5 \mathrm{~mL})$, BPC $(24 \times 236 \mathrm{mg}, 24 \times 0.6 \mathrm{mmol})$, and triethylamine $(24 \times 0.14 \mathrm{~mL}, 24 \times 1 \mathrm{mmol})$ and the mixtures were stirred at room temperature for 30 min . Then, the amines $\mathbf{1 8}\{1-7\}(2 \times 12 \times 0.5 \mathrm{mmol})$ and amines $\mathbf{1 8}\{8-12\}(2 \times 4 \times 5 \mathrm{mmol})$ were added and stirring at room temperature was continued for 12 h . The reaction mixtures were filtered to afford $\mathbf{1 0}\{1 ; 3,4\}$ and $\mathbf{1 0}\{2 ; 1-7\}$ (Workup A). The filtrates containing the products $\mathbf{1 0}\{1 ; 1,2,5-12\}$ and $\mathbf{1 0}\{2 ; 8-12\}$ were evaporated in vacuo ( $40{ }^{\circ} \mathrm{C} / 2 \mathrm{mbar}$ ) and the residues (resins) were dissolved in dichloromethane $(15 \times 2.5 \mathrm{~mL})$ and purified sequentially by DFCC over aluminium oxide ( $5 \mathrm{~g}, \mathrm{~d}=15 \mathrm{~mm}$ ) by gradient elution with a) EtOAc ( 30 mL ) and b)
$\operatorname{EtOAc}-\operatorname{EtOH}(5: 1,50 \mathrm{~mL})$. The combined eluates were evaporated in vacuo $\left(60^{\circ} \mathrm{C} / 1 \mathrm{mbar}\right)$ to afford compounds $\mathbf{1 0}\{1 ; 1,2,5-12\}$ and $\mathbf{1 0}\{2 ; 8-12\}$ (Workup B). The following compounds were prepared in this manner.

### 3.7.1. 2-Methyl-6-(5-oxo-1-phenylpyrrolidin-3-yl)-N-pentylpyrimidine-5-carboxamide ( $\mathbf{1 0}\{1 ; 1\}$ )

## 4. Conclusions

2-Substituted 6-(5-oxo-1-phenylpyrrolidin-3-yl)pyrimidine-5-carboxamides $\mathbf{1 0}$ as a novel type of conformationally constrained 2-(heteroaryl)ethylamines are available in six-steps from itaconic acid (11). The synthetic pathway consists of two parts: (a) a five-step preparation of pyrimidine-5carboxylic acids $\mathbf{1 7}\{1,2\}$ as the key-intermediates and (b) combinatorial solution-phase BPC-mediated amidation of $\mathbf{1 7}\{1,2\}$ with primary and secondary amines $\mathbf{1 8}\{1-12\}$ to give the title compounds $\mathbf{1 0}\{1,2 ; 1-12\}$ in good overall yields and purity upon simple workup. The method is general and substrate-independent. All 24 amidations proceeded smoothly and no major differences in reactivity was observed with respect to the $\mathrm{C}(2)$ substituent in the pyrimidine-5-carboxylic acids $\mathbf{1 7}$. On the other hand, the secondary amines $\mathbf{1 8}\{8-12\}$ were less reactive in these amidations than the primary amines $\mathbf{1 8}\{1-7\}$. Consequently, a 10 -fold excess of secondary amines $\mathbf{1 8}\{8-12\}$ was employed in order to assure completion of the amidation reaction. Besides, preparation of the 2-chloro analogue of 16, e.g., by treatment of $\mathbf{1 4}$ with methyl carbamimidate followed by demethylation and chlorination, would enable functionalization at position 2 in the pyrimidine ring, either by $\mathrm{S}_{\mathrm{N}} \mathrm{Ar}$ reaction, or by cross-coupling reaction. These results also indicate that the above synthetic method could serve as a useful tool for the preparation of novel compound libraries for pharmaceutical and other practical applications.

27. Since satisfactory results were obtained with evapotative workup and DFCC, the use of scavenging reagents such as solid supported tosyl chloride or propionyl chloride was not explored. Besides, covalent binding of scavenging reagents to products containing hydroxy and amino functions would probably make the isolation of products more difficult.
28. The above method is applicable for the synthesis of libraries of racemic compounds $\mathbf{1 0}$ for primary testing and screening. However, for a larger scale synthesis of certain enantiomerically pure final products 10, a modified 'chiral pool' synthesis of non-racemic $\mathbf{1 0}$ utilizing enantiomerically pure starting compound $\mathbf{1 2}$ should be developed.
