

# Supplementary Materials: Multivariate Chemical Image Fusion of Vibrational Spectroscopic Imaging Modalities

Aoife A. Gowen and Ronan M. Dorrepaal

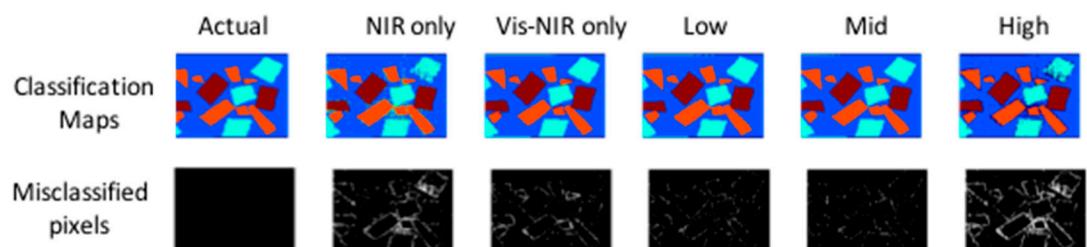

## 1. SM1: Analysis of Image Set 2

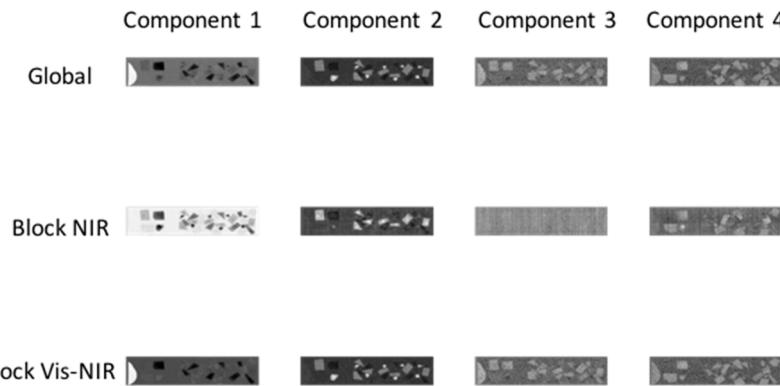

**Figure S1.** PCA applied to chemical image cubes from different modalities (image set 2): First five NIR and Vis-NIR PC score images are shown. The main salient features used for registration were the dark regions in PC 1. All images scaled to range mean  $\pm 4$  standard deviations.

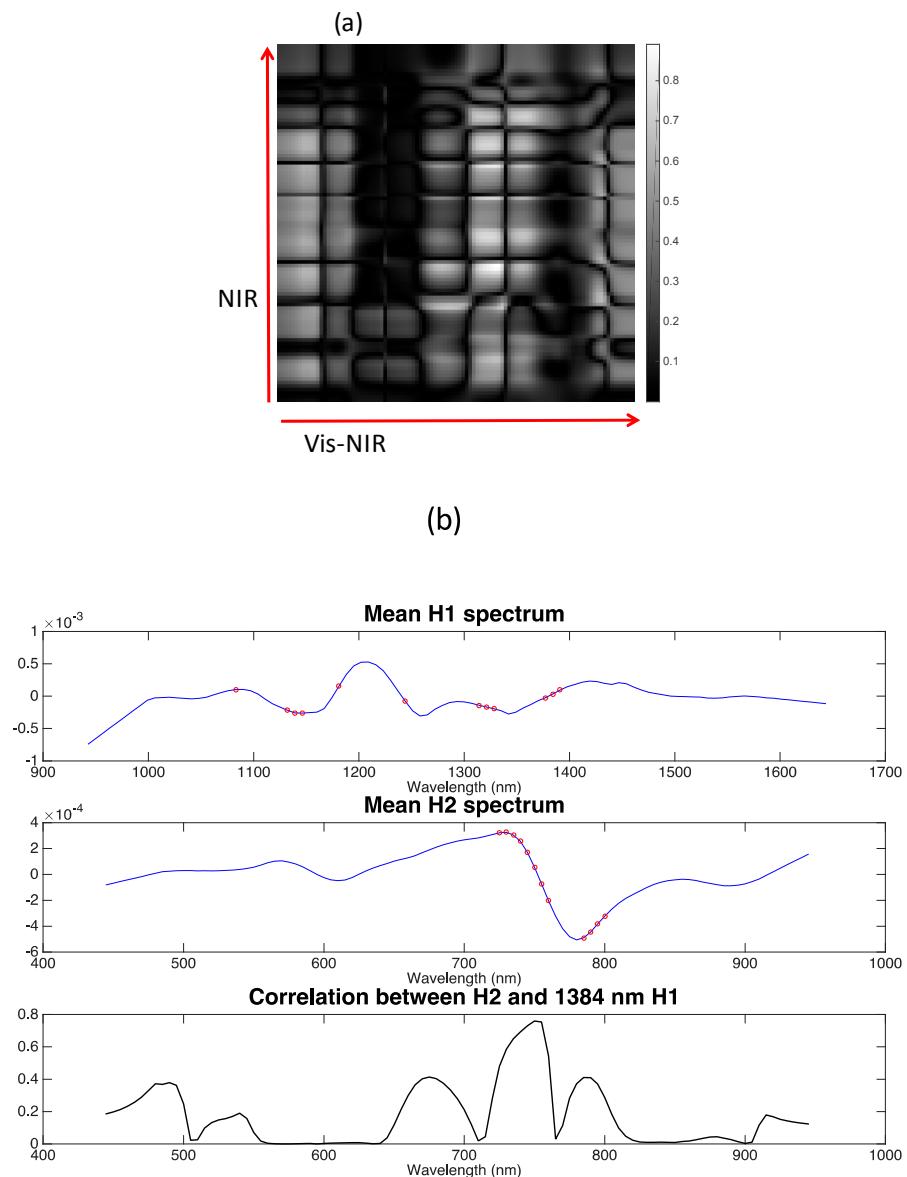

**Figure S2.** Multivariate image registration for image set 2. Gray pixels show mis-matching pixels, white pixels show matching pixels. (a) Original NIR and Vis-NIR mask images overlaid; (b) NIR and Vis-NIR mask images overlaid after down-sampling the Vis-NIR mask; (c) NIR and Vis-NIR mask images overlaid after down-sampling and applying affine transformation to the Vis-NIR mask.

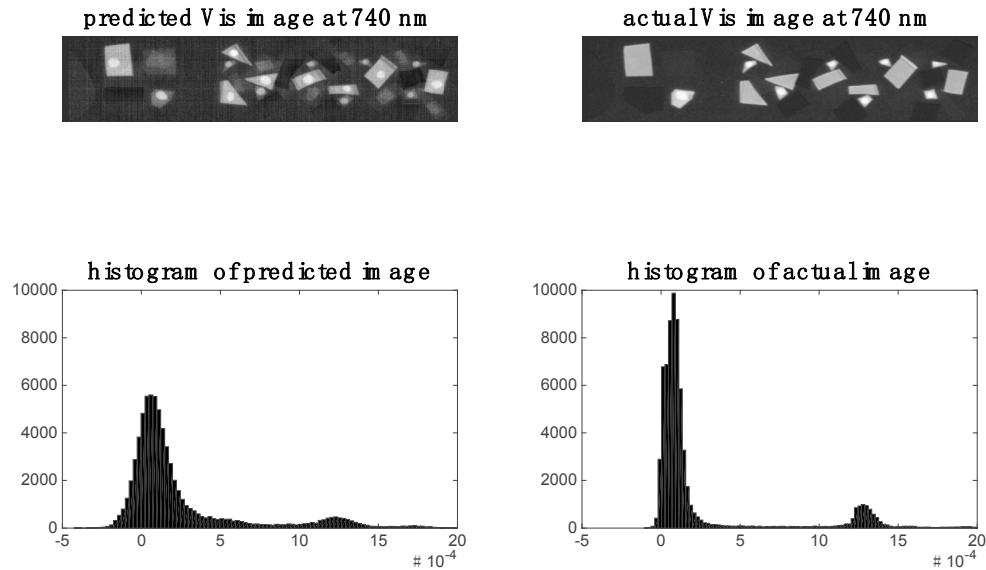

**Figure S3.** PLS-DA pixel classification applied to separate NIR, separate Vis-NIR, low-, mid- and high-level fused NIR-Vis-NIR data for image set 2. Actual target classification map is shown in leftmost upper panel. Classification maps for Class 1–5 resulting from PLS-DA modelling shown in upper panels. Misclassified pixels for each model shown as white pixels in lower panel. Further model details are shown in Table S1.

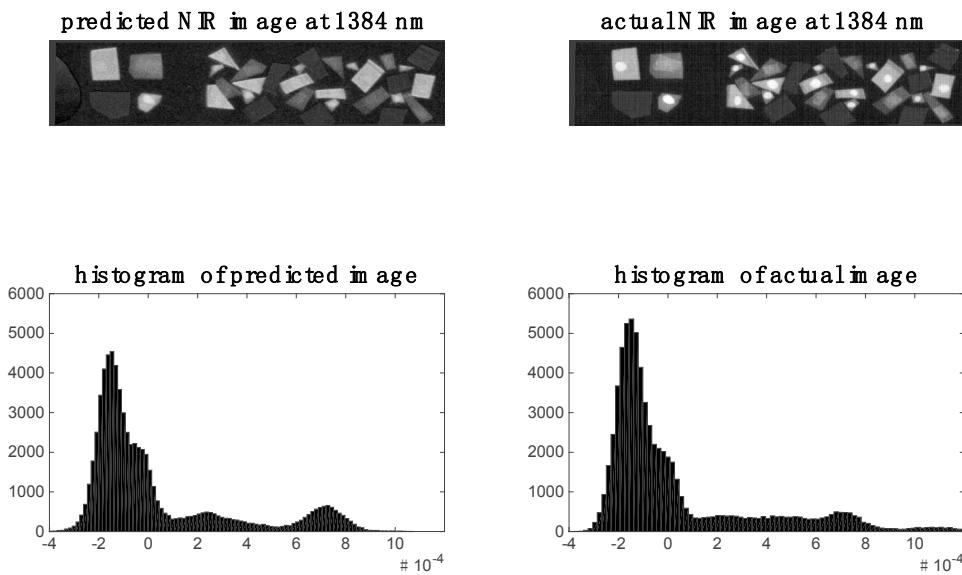

**Figure S4.** Co-inertia global and block (NIR = near infrared, Vis-NIR = Visible-near infrared) score images for 1st four co-inertia components of image set 2.

**Figure S5.** Correlation analysis: (a) correlation map showing correlation between all NIR and Vis-NIR wavelengths; (b) top panel: mean NIR spectrum, red dots indicating NIR wavelengths with correlation coefficients > 0.8, middle panel: mean Vis-NIR spectrum, red dots indicating Vis-NIR wavelengths with correlation coefficients > 0.8, lower panel: correlation between all Vis-NIR wavelengths and the NIR peak at 1384 nm. This corresponds to a horizontal slice of the correlation map at the row corresponding to 1384 nm.

**Figure S6.** Vis-NIR image at 740 nm: left hand side shows image (and corresponding histogram) predicted by PLS regression model applied to NIR data; right hand side shows actual down-sampled Vis-NIR image (and corresponding histogram) at 740 nm.

**Figure S7.** Prediction of NIR image at 1384 nm for image set 2: left hand side shows image (and corresponding histogram) predicted by PLS regression model applied to Vis-NIR data; right hand side shows actual NIR image (and corresponding histogram) at 1384 nm.

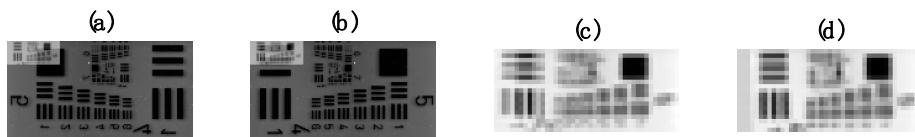

**Table S1.** Classification performance of PLS-DA pixel classification applied to separate NIR, separate Vis-NIR, low-, mid- and high-level fused NIR-Vis-NIR data in terms of % correct class and number of latent variables (#LV) used in each model. Corresponding pixel classification maps are shown in Figure S3.

Dataset	NIR only	Vis_NIR only	Low	Mid	High
% Correct Class	90.90%	93%	94.30%	95.10%	88.10%
#LV in PLS-DA	10	7	5	5	17

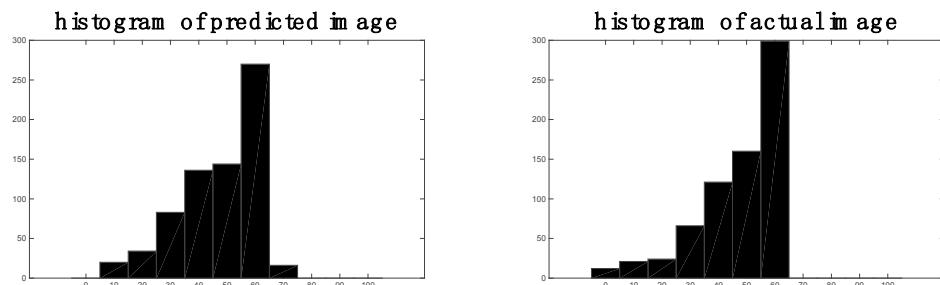

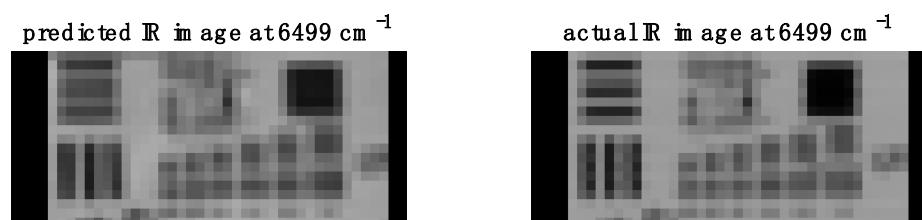

**Table S2.** Co-inertia analysis: contribution of block to global loadings and components and correlation between block and global scores for image set 2.

Component	1	2	3	4	5	6
Contribution of NIR block loadings to global loadings (%)	38.43	16.77	8.82	7.54	5.24	7.73
Contribution of Vis-NIR block loadings to global loadings (%)	61.57	83.23	91.18	92.46	94.76	92.27
Contribution of NIR block components to global components (%)	11.73	2.82	0.71	0.53	0.21	0.31
Contribution of Vis-NIR block components to global components (%)	42.66	90.11	59.06	94.94	91.88	54.43
Correlation between NIR block scores and global scores	0.66	0.675	0.198	0.438	0.226	0.125
Correlation between Vis-NIR block scores and global scores	0.954	0.999	0.998	1	1	0.999

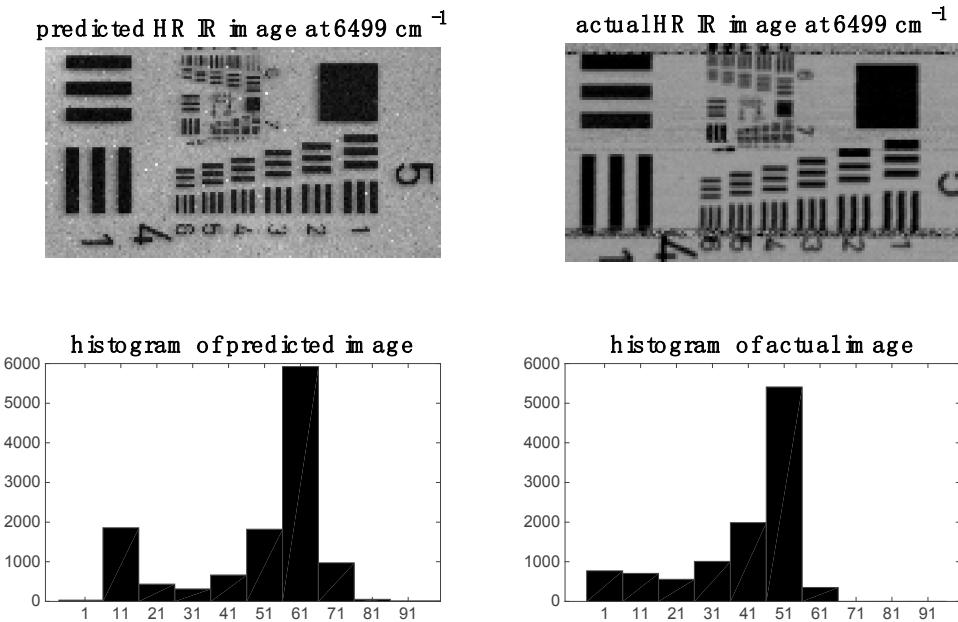

## 2. SM2: Analysis of Image Set 3

**Figure S8.** Multivariate image registration for image set 3. (a) Original IR and Raman PC images overlaid; (b) IR and Raman PC images overlaid after rotating and flipping Raman mask; (c) IR and Raman PC images overlaid after rotating, flipping and down-sampling the Raman mask; (d) IR and Raman PC images overlaid after rotating, flipping, down-sampling and applying affine transformation to the Raman mask.

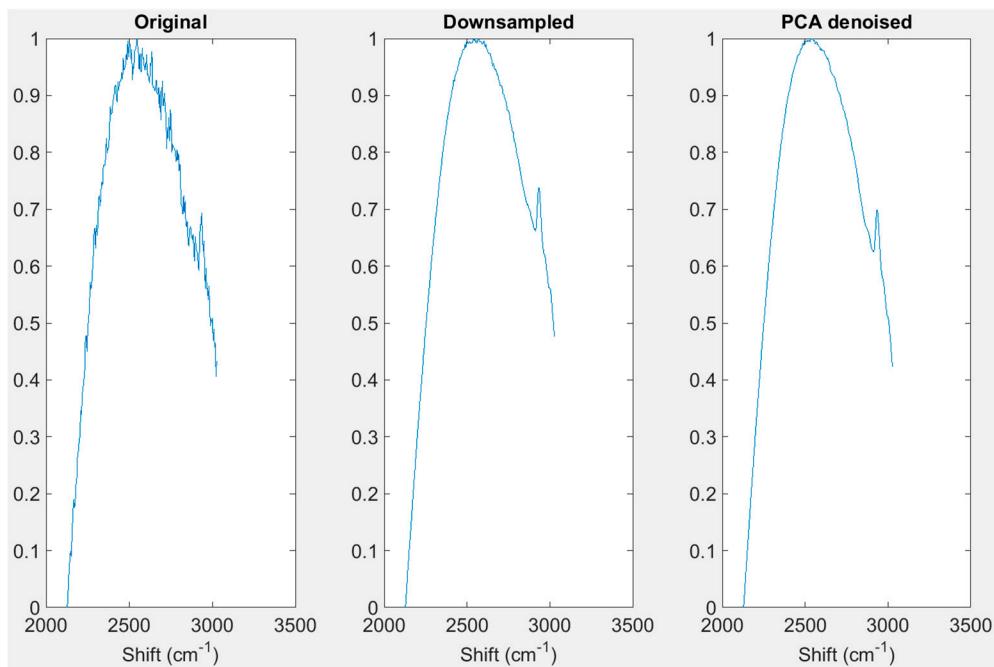

**Figure S9.** Prediction of IR image at  $6499\text{ cm}^{-1}$  for image set 3: left hand side shows image (and corresponding histogram) predicted by PLS regression model applied to Raman data; right hand side shows actual IR image (and corresponding histogram) at  $6499\text{ cm}^{-1}$ .

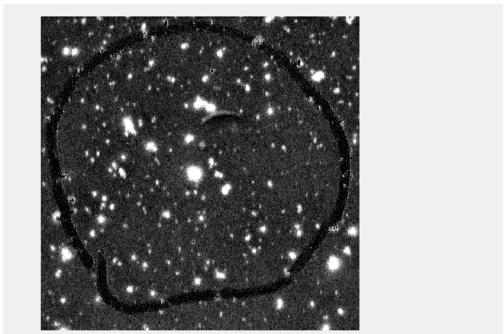

**Figure S10.** Resolution enhancement of image set 3, IR image at  $6499\text{ cm}^{-1}$ : left hand side shows high resolution (HR: pixel size =  $6.2\text{ }\mu\text{m}$ ) IR image and histogram predicted by PCA de-noised Raman spectra; right hand side shows actual HR IR image and histogram at  $6499\text{ cm}^{-1}$ .

### 3. SM3: Resolution Enhancement

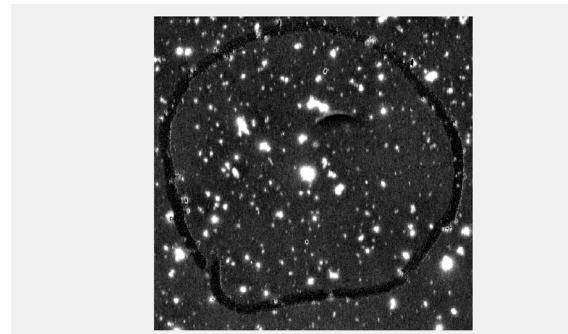

**Figure S11.** Effect of down-sampling and PCA de-noising on Raman pixel spectra.

Predicting with original data

Predicting with PCA denoised data

**Figure S12.** Effect of PCA de-noising on prediction of IR chemical images from Raman spectra.
