

Supplementary Materials: Preparation of Photoirradiation Molecular Imprinting Polymer for Selective Separation of Branched Cyclodextrins

Haoran Fan, Jinpeng Wang, Qingran Meng, Xueming Xu, Tianming Fan and Zhengyu Jin

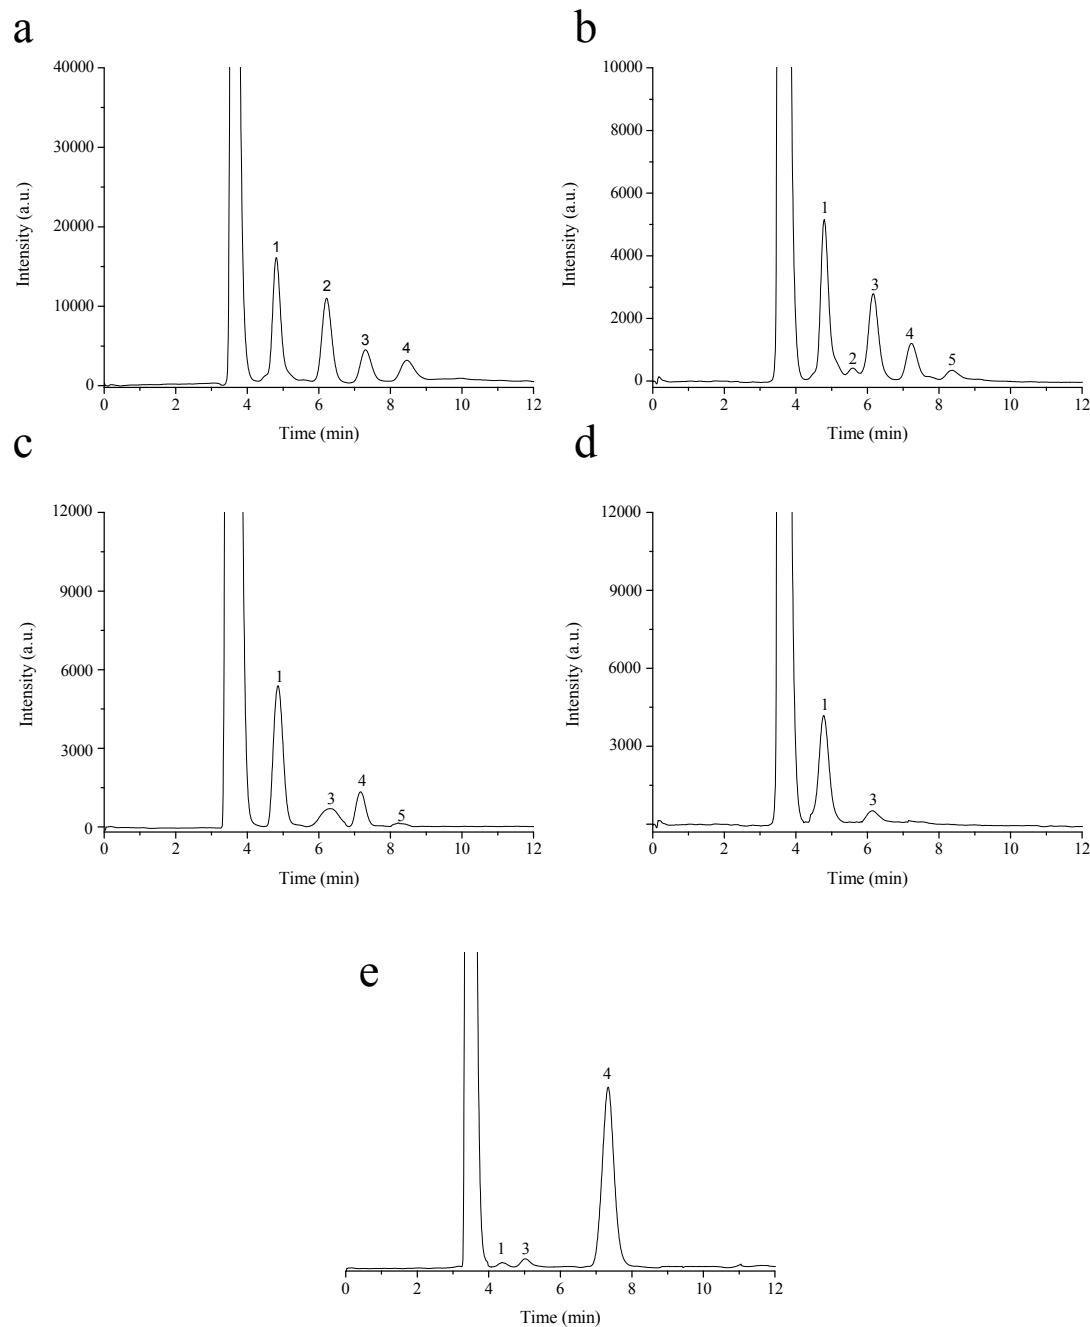

Figure S1. HPLC of samples: (a) standard samples; (b) the synthetic crude 6-O- α -D-maltosyl- β -cyclodextrin (G2- β -CD); (c) the synthetic crude G2- β -CD in 50% methanol; (d) the precipitation after irradiation under 365 nm light; (e) the separated and purified G2- β -CD by molecularly imprinted polymer (MIP). Peaks: 1. maltose; 2. maltosyl maltose; 3. β -cyclodextrin; 4. maltosyl β -cyclodextrin; 5. dimaltosyl β -cyclodextrin. a.u.: arbitrary units.

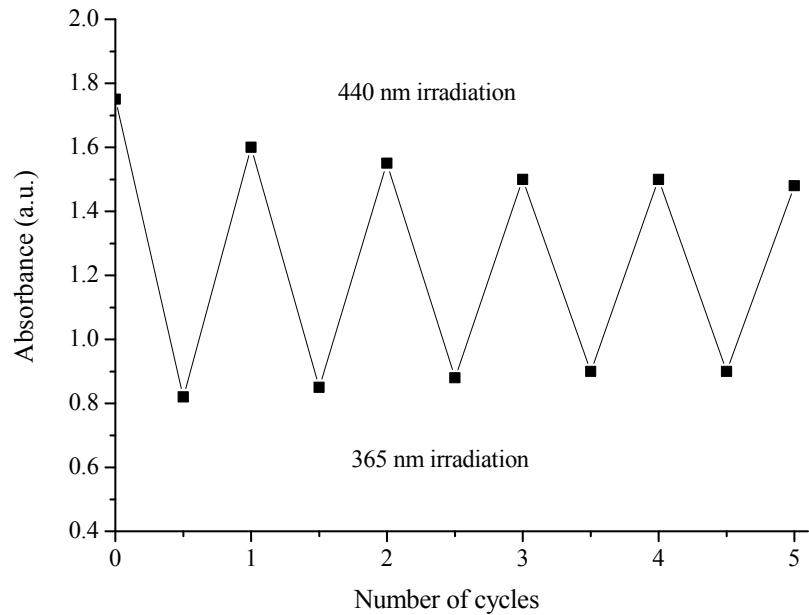

Figure S2. Reversibility of the photoisomerization process of azobenzene chromophore in MIP at 25 °C. In each cycle, the azo monomer solution was irradiated firstly with 365 nm ultraviolet (UV) light for 50 min and then with 440 nm visible light for 10 min, respectively. a.u.: arbitrary units.
