## **1. General Information**

Unless otherwise noted, all reagents and solvents were purchased from the commercial sources and used as received. The TMSBr and InBr<sub>3</sub> used was purchased from Sigma-Aldrich.

Thin layer chromatography (TLC) was used to monitor the reaction on Merck 60 F254 precoated silica gel plate (0.2 mm thickness). TLC spots were visualized by UV-light irradiation on Spectroline Model ENF-24061/F 254 nm. Other visualization method was staining with a basic solution of potassium permanganate or acidic solution of ceric molybdate, followed by heating.

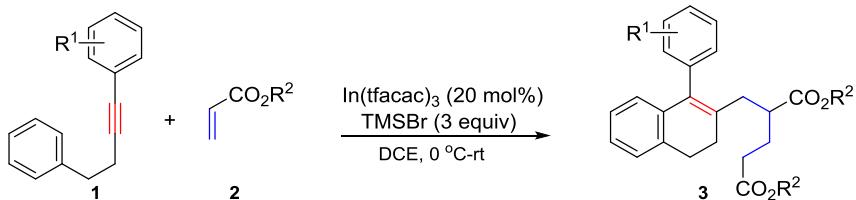

Flash column chromatography was performed using Merck silica gel 60 with analytical grade solvents as eluents.

<sup>1</sup>H NMR, <sup>13</sup>C NMR and 2D NMR spectra were recorded using BrukerAvance 400 MHz spectrometers. Corresponding chemical shifts are reported in ppm downfield relative to TMS and were referenced to the signal of chloroform-d ( $\delta$ =7.26, singlet). Multiplicities were given as: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, brs = broad singlet, dd=doublet of doublets, td= triplet of doublets. Values of coupling constant are reported as *J* in Hz.

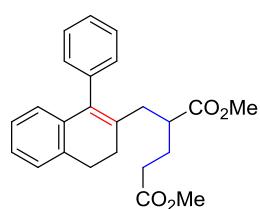

HRMS spectra were recorded on a Waters Q–TofPermier Spectrometer.

## 2. Experimental Sections

### 2.1 General procedure of In(III)-TMSBr-catalyzed Cascade Reaction of **1** with **2**

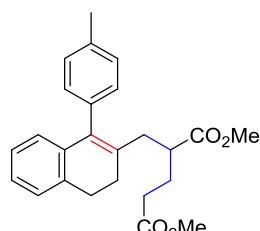

A dry reaction tube was charged with aryl alkyne **1** (0.4 mmol), acrylate **2** (1.2 mmol), indium (III) trifluoroacetylacetone ( $\text{In}(\text{tfacac})_3$ , 20 mol%, 0.08 mmol, 45.9 mg) and  $\text{DCE}$  (2 mL) under  $\text{N}_2$  atmosphere at  $0^\circ\text{C}$ . Bromotrimethylsilane ( $\text{TMSBr}$ , 3 equiv, 1.2 mmol, 183.6 mg) was added and the reaction mixture was stirred at room temperature for 2 h. Upon completion of the reaction as indicated by TLC analysis, the residue was directly purified by flash column chromatography on silica gel (eluent: hexane/ethyl acetate 10:1) to afford the desired product **3**.
