Figure S1. Illustration of the preparation of Gd^{3+} -incorporated mesoporous silica nanoparticles (MSN) (Gd_2O_3 @MSN) particles for magnetic resonance imaging

Figure S2. Molecular structure of sodium alginate (SA).

Figure S3. (a) FT-IR spectra of $\text{NH}_2\text{-Gd}_2\text{O}_3\text{@MSN-RhB}$ and RhB . Macroscopic images of (b) $\text{NH}_2\text{-Gd}_2\text{O}_3\text{@MSN}$ NPs and (c) $\text{NH}_2\text{-Gd}_2\text{O}_3\text{@MSN-RhB}$ NPs .

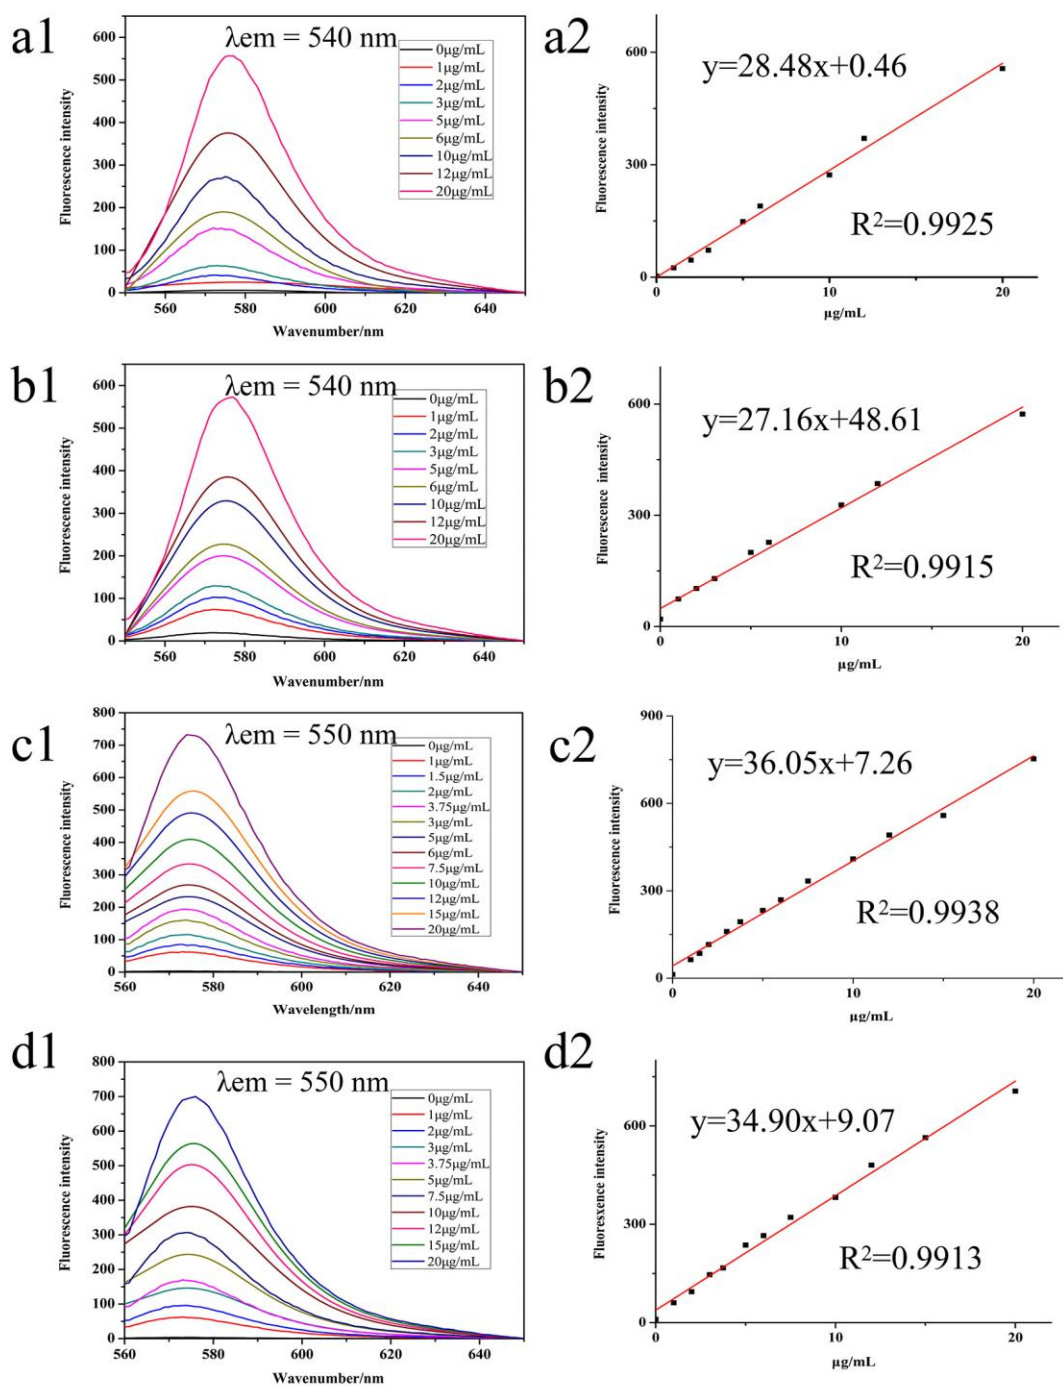

Figure S4. (a1-d1) Fluorescence response of RhB at different solution (ddH₂O, pH 7.4, pH 5.5 and pH 4.5 buffer) and concentrations in the 0.0–20.0 $\mu\text{g/mL}$ rang, respectively. (a2-d2) Calibration curve of RhB.

Figure S5. Release curves of SA-Gd₂O₃@MSN-RhB and NH₂-Gd₂O₃@MSN-RhB at different pH values.

Figure S6. Colloidal stability of SA-Gd₂O₃@MSN. (a) Photograph images of Gd₂O₃@MSN, NH₂-Gd₂O₃@MSN and SA-Gd₂O₃@MSN dispersed in water (①), saline (②) and medium (③) with a concentration of 2 mg/mL. (b) TEM images of SA-Gd₂O₃@MSN after 24 h incubation.

Figure S7. Colloidal stability of SA-Gd₂O₃@MSN at different pH values. (a) SA-Gd₂O₃@MSN in acid solution (pH 5.5, 4.5) begin to aggregate within 2 hour, reaching aggregates hydrodynamic diameters of approximately 400 nm and 450 nm, respectively, after 24 hours of incubation. (b) In contrast, SA-Gd₂O₃@MSN at the pH 7.4 solution do not aggregate over 24 hours. (c) This point is further demonstrated visually after 24 hours when most SA-Gd₂O₃@MSN have sedimented in acid solution and remain transparent in pH 7.4 solution (well-suspended).

Figure S8. Release of Gd³⁺ in different buffers.

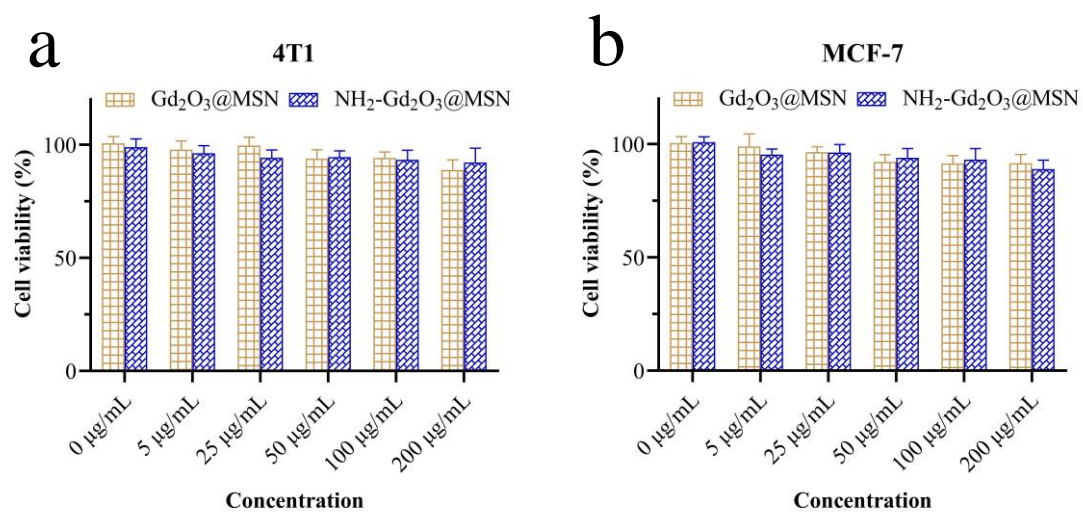

Figure S9. Cytotoxicity against 4T1 (a) and MCF-7 (b) cells after incubation with different concentrations of various NPs for 24 h.

Figure S10. Morphology of human red blood cells upon treatment with 0.9% NaCl, ddH₂O and SA-Gd₂O₃@MSN (50, 800 µg/mL) for 4 h.

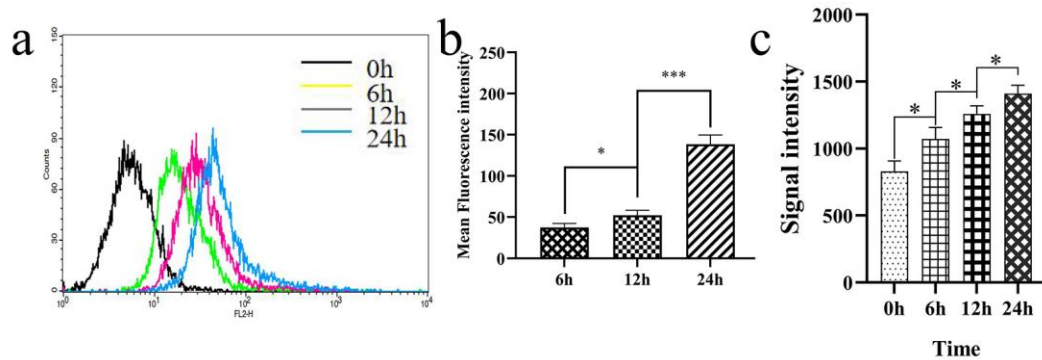

Figure S11. (a) FCM images of 4T1 cells with the treatment of SA-Gd₂O₃@MSN-RhB NPs for 0, 6, 12 and 24 h. (b) Mean fluorescence intensity corresponding to (Fig. 6a). (c) MRI intensity of 4T1 cells after incubation with SA-Gd₂O₃@MSN-RhB at different times. (*p < 0.05, ***p < 0.001).

Figure S12. H&E staining of 4T1 xenografts in Balb/c mice.
