##### 1.1. *1,5,5-trimethyl-3-(prop-2-yn-1-yl)imidazolidine-2,4-dione (6b)*

Sodium hydride (1.1 equiv.) was slowly added to a solution of succinimide (1 equiv.) in dry DMF (10 mL). After 2 h at room temperature propargyl bromide (80% in toluene, 1.2 equiv.) was added and stirring was continued for a further 2 h under reflux. The resultant residue was concentrated under vacuum then extracted with AcOEt ( $3 \times 20$  mL). The combined organic layers were washed with brine, dried ( $\text{MgSO}_4$ ), filtered, and evaporated in vacuo. The residue was purified by flash column chromatography using a mixture of cyclohexane / AcOEt (50 / 50) as eluent.

##### 1.2. *2-(but-3-yn-1-yl)-3-oxoisindolin-1-yl acetate (8g)*

To a stirred solution of **6g** (1 equiv.) in MeOH (10 mL), was added  $\text{NaBH}_4$  (4 equiv.) at 0 – 20 °C and the mixture was stirred for an hour. After completion of the reaction, saturated sodium bicarbonate solution (10 mL) was added and the organic layer was extracted with DCM (3 x 20 mL). The combined organic layers were washed with brine, dried ( $\text{MgSO}_4$ ), filtered, and evaporated in vacuo. The crude product was purified by flash column chromatography using a mixture of cyclohexane/AcOEt (50 / 50) as eluent. Resulting product was then dissolved with DMAP (0.1 equiv.) in DCM, followed by the addition of  $\text{Ac}_2\text{O}$  (2 equiv.) and  $\text{Et}_3\text{N}$  (2 equiv.).

The reaction mixture was stirred at room temperature for 24 h. Solvent was removed under reduced pressure and the crude product was purified by flash column chromatography using a mixture of cyclohexane/AcOEt (70 / 30) as eluent.

#### ***1.3.1. Typical procedure of condensation***

To an ice chilled solution of dimethyl or diethyl α-bromophthalate in dry acetonitrile (10 mL) was added under argon 2 equiv. of the appropriate amine diluted in 10 mL of acetonitrile. The mixture was stirred at room temperature for 8 h. The salt that formed was removed by filtration and the filtrate was concentrated under reduced pressure. The residue was purified by flash column chromatography using a mixture of cyclohexane/AcOEt (70 / 30) as eluent.

#### ***1.3.2. Typical procedure of alkylation***

To a mixture of phthalimidines (±)-**12a-f**, potassium carbonate (1.09 equiv.), and 20 mL of acetonitrile was added (1.2 equiv.) of the appropriate alkyl bromide. The reaction mixture was refluxed over-night. The cooled resulting suspension was filtered off. The filtrate was concentrated in vacuo, diluted with water, and extracted with DCM (3 x 20 mL). The organic phase was dried over MgSO<sub>4</sub> and evaporated under reduced pressure. The residue was purified by flash column chromatography using a mixture of cyclohexane/AcOEt (75 / 25) as eluent.
