

Supplementary Materials: In Vitro Assessment of the Expression and T Cell Immunogenicity of the Tumor-Associated Antigens BORIS, MUC1, hTERT, MAGE-A3 and Sp17 in Uterine Cancer

Anke Vanderstraeten, Sandra Tuyaeerts, Tina Everaert, Rieta Van Bree, Godelieve Verbist, Cathérine Luyten and Frederic Amant

Table S1. TAA expression in normal tissues and commercial cell lines. (A) A panel of normal human tissues was assayed for expression of *BORIS*, *MAGE-A3*, *Sp17* and *hTERT* by quantitative RT-PCR. Values represent the mean normalized expression of the TAA normalized to β -actin and β -glucuronidase; (B) A set of commercially available gynecological tumor cell lines was analyzed for expression of *BORIS*, *MAGE-A3*, *Sp17* and *hTERT* by quantitative RT-PCR. Values represent the mean normalized expression of the TAA normalized to β -actin and β -glucuronidase. Cells are coded using a color scale from green (low expression) over yellow and orange to red (high expression).

Table S7. Raw data T cell responses. This table displays the ratio of the percentage of CD137-positive T cells after stimulation with the indicated TAA compared to the unstimulated sample, for each PBMC sample tested in the T cell response assay. For samples scored positive (i.e., ratio ≥ 2), the actual percentage of CD137-positive T cells after stimulation with the indicated TAA subtracted by the percentage of CD137-positive T cells in the unstimulated sample is shown.
