

Supplementary Figure S1. Effects of cigarette smoke exposure on total and differential numbers of cells in BAL. The mice were exposed for 5 days or 30 days to CS or air, and BAL was isolated. All cell types were enumerated by cytospin counts. * $p < 0.05$ when compared to control group; # $p < 0.05$ when compared to CS 5 days group. Data are presented as the means \pm SEM of 7–10 mice per group. All statistical analyses were performed with a one-way ANOVA, followed by a Tukey's *post hoc* test.
