

Supplementary File 1

Supplementary Figure 1. Inhibitory effect of bLF against DENV-1-4 infection. Vero cell monolayers were infected with DENV1-4 at a MOI of 5, with or without bLF (200 μ g/ml). After 24 hours, the cells were fixed and stained with DAPI and rabbit anti-DENV-1-4 antibodies, followed by goat anti-rabbit Alexa Fluor 488-conjugated secondary antibody. Images were observed and captured by fluorescent microscope.
