

Figure S1. Electrophoretic strips of three DNA extraction methods for *Pseudomonas* spp. and *Fusarium oxysporum*, and optimizing annealing temperature using different PCR. A. The effect of three DNA extraction methods for *Pseudomonas* spp. and *Fusarium oxysporum*, the same row of which represents the same extraction method, and the same column represents the same microorganism. Method I referenced to Zhou et al. (1996). Methods II and III optimized humus removal. Annealing temperature was at 58 °C. B. Two PCR effects of 8 random soil DNA samples extracted by method III (Left: gradient PCR with annealing temperature from 50 °C to 60 °C, eight gradients; Right: conventional PCR, 58 °C for annealing). C. Touchdown PCR effects of 1 random soil DNA samples extracted by method III for FO. D. The electrophoretic strips of negative cloning vector PCR. Conventional PCR by ThermoFisher Scientific A24812, USA, gradient PCR by BIO-RAD T100TM, USA and touchdown PCR by BIO-RAD T100TM, USA. AT annealing temperature. M DL2000 Plus DNA Marker.

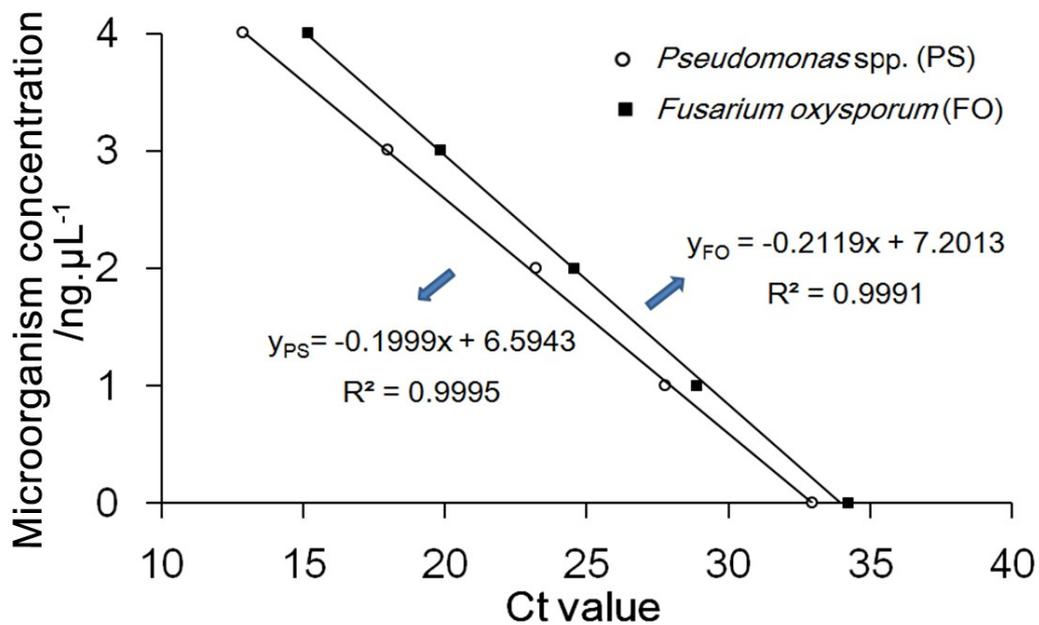

Figure S2. Standard curve of concentration and Ct value for *Pseudomonas* spp. and *Fusarium oxysporum*.

Table S1. Sequence of DNA fragments inserted into pMD19-T vector.
