

SUPPLEMENTARY INFORMATION FOR

Gene expression profiling reveals that PXR activation inhibits hepatic PPAR α activity and decreases FGF21 secretion in male C57Bl6/J mice

Sharon Ann Barretto ^{1,*}, Frederic Lasserre ^{1,*}, Anne Fougerat ¹, Lorraine Smith ¹, Tiffany Fougeray ¹, Celine Lukowicz ¹, Arnaud Polizzi ¹, Sarra Smati ¹, Marion Régnier ¹, Claire Naylies ¹, Colette Bétoulières ¹, Yannick Lippi ¹, Hervé Guillou ¹, Nicolas Loiseau ¹, Laurence Gamet-Payraastre ¹, Laila Mselli-Lakhal ¹ and Sandrine Ellero-Simatos ^{1,*}

Supplementary Table 1: Gene Enrichment Analysis on the 1029 hepatic genes induced by PCN-treatment only in WT mice (prototypical *Pxr* target genes, fold-change>1.5 & adjusted p-value<0.05) in the liver. See enclosed excel file.

Supplementary Table 2: Impact on PCN treatment on all XMEs in the liver and in the ileum. See enclosed excel file.

Supplementary Table 3: Primers used for qPCR

Supplementary Figure 1: Effect of PCN treatment on additional plasmatic parameters. Data are shown as mean \pm SEM of n=5-6 per group. *p \leq 0.05, **p \leq 0.01, ***p \leq 0.005 for PCN effect using 2-way ANOVA and Bonferroni's post-tests.

Supplementary Figure 2: Heatmap representing the significantly regulated genes (fold-change>1.5 & corrected p-value < 0.05). Hierarchical clustering is also shown, which allows the definition of five gene clusters. For each gene cluster, the mean expression value is shown on the box-plots.

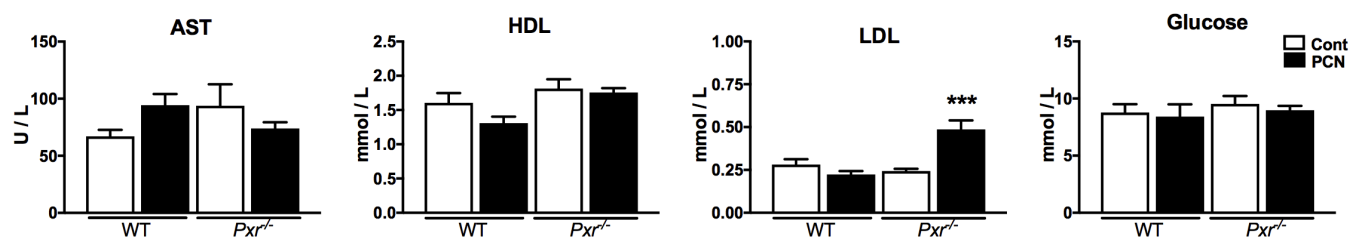

Supplementary Figure 3: Microarray data and complementary qPCR confirmation in the liver for selected genes involved in *de novo* lipogenesis. Data are shown as mean \pm SEM of n=5-6 per group. *p \leq 0.05, **p \leq 0.01, ***p \leq 0.005 for PCN effect and #p \leq 0.05, ##p \leq 0.01, ###p \leq 0.005 for genotype effect using 2-way ANOVA and Bonferroni's post-tests.

Supplementary Figure 4: Microarray data and complementary qPCR confirmation in the liver for selected genes involved in (a) cholesterol synthesis and (b) fatty acid / cholesterol transport. Data are shown as mean \pm SEM of n=5-6 per group. *p \leq 0.05, **p \leq 0.01, ***p \leq 0.005 for PCN effect and #p \leq 0.05, ##p \leq 0.01, ###p \leq 0.005 for genotype effect using 2-way ANOVA and Bonferroni's post-tests.
