

Supplementary figure 1. Western blotting of full-length PARP, cleaved PARP, IκBα, and NF-κB in AGS cells treated with menadione. AGS cells were treated with indicated concentrations of menadione for 12 h. After incubation, cell lysates were collected to conduct Western blotting to detect full-length PARP, cleaved PARP, IκBα, and NF-κB. β-actin was used as an internal control.
