

Supplementary Fig. 1- Mean density of thresholded tissue above 125 measured in mg of hydroxyapatite per cubic centimeter. This corresponds to the bone volumes found in figure 7. There were very small volumes of tissue from the control group and the 0.8 mg of FK506 group resulted in tissue above the threshold. The density of the newly formed tissue in the 3.2 mg treatment group is comparable to that of the density of the BMP-2 treated samples.
