

Supplementary Material

Gabriele Loers, Ralf Kleene, Ute Bork, Melitta Schachner: The interactions of the 70 kDa fragment of cell adhesion molecule L1 with topoisomerase 1, peroxisome proliferator-activated receptor γ and NADH dehydrogenase (ubiquinone) flavoprotein 2 are involved in gene expression and neuronal L1-dependent functions

Supplementary Figure 1. L1-70 interacts with TOP1, PPAR γ and NDUFV2, but not with other L1 binding partners in neurons. Cultured cortical neurons were treated with vehicle (-) or with the serine protease inhibitor aprotinin and subjected to proximity ligation with L1 antibody and antibodies against SFPQ, NonO, PSPC1, WDR5, TOP1, HistH1, Nup93, Hsc70, SYT1, imp β 1, ER α , RXR, PPAR γ , NDUFV2, AR, VDR or GAPDH. Representative images of vehicle- and aprotinin-treated neurons stained with the mouse L1 antibody C-2 and rabbit antibodies against SFPQ, NonO, PSPC1, WDR5, HistH1, Nup93, Hsc70, SYT1, imp β 1, ER α , RXR, AR, VDR or GAPDH are shown. Nuclei are stained with DAPI. Scale bars: 10 μ m.

Supplementary Table 1. Raw ELISA data corresponding to data shown in Figure 3a. TOP1 was coated and incubated with different concentrations of L1-ICD. Mean values and standard deviation of triplicates are shown for three independent experiments.

TOP1
