**Keywords:**  $\alpha$ -Campholenic aldehyde, acid-catalyzed rearrangement, intramolecular cyclization.

*p*-Toluenesulfonic acid (35 mg, 0.20 mmol) was added to a stirred mixture of campholenic aldehyde (**1**) (725 mg, 3.81 mmol) and *p*-toluenesulfonamide (1.22 g, 6.96 mmol) in toluene (20 mL). Then a Dean-Stark trap device was fit and the reaction refluxed for 0.5 h. After that, the mixture was cooled to 0°C, filtered through a silica gel pad and the solvent evaporated under reduced pressure to yield a residue (1.30g) which was purified by flash chromatography on silica gel, using a 2:1 Hexane/Et<sub>2</sub>O mixture as eluent, to give the title compound **2** (517 mg, 1.69 mmol, 44%).

Melting point: 110.7–114.8 °C (White crystals, from hexane)
