Supplementary Data

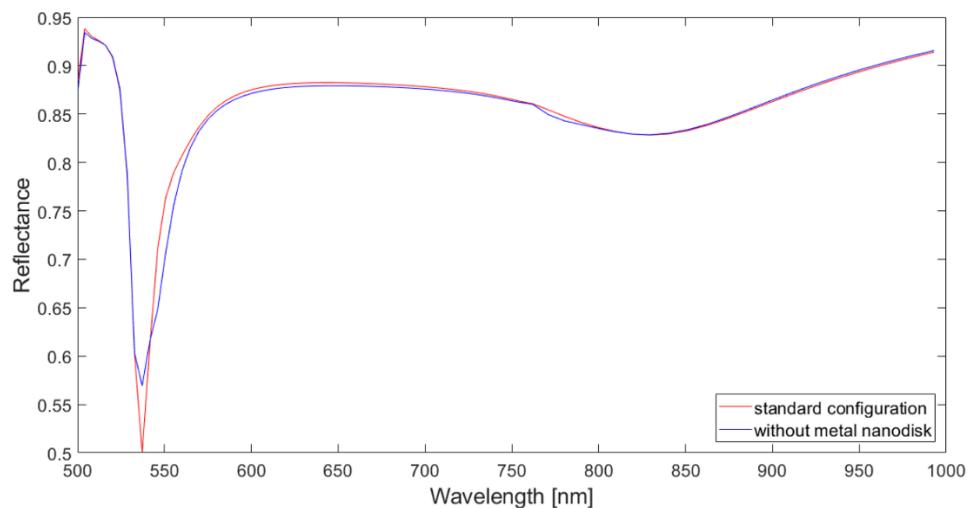

Figure S1. Calculated reflectance spectra for $t_{\text{bio}} = 20$ nm of 500 nm period Al/polymer plasmonic 2D crystals ($d = 150$ nm, $h = 150$ nm) with Al disks (red curve) and without Al disks (blue curve).

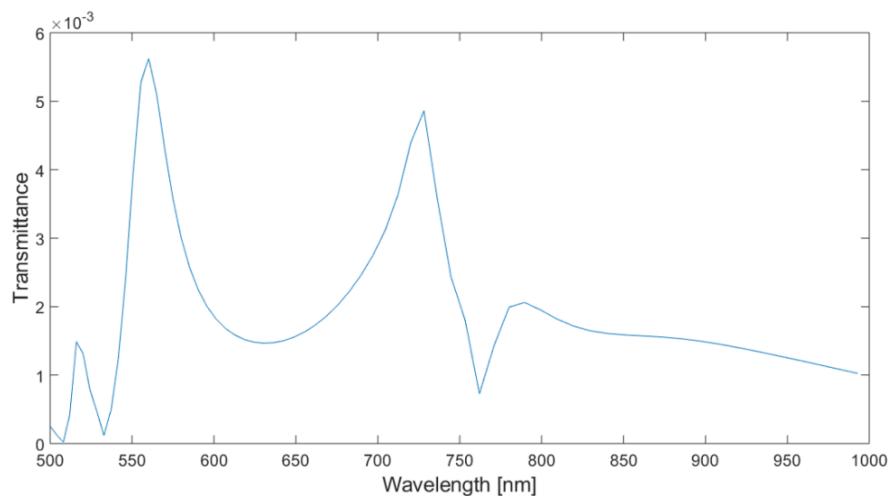

Figure S2. Calculated transmittance spectrum of a 500 nm period Al/polymer plasmonic 2D crystal for $d = 150$ nm and $h = 150$ nm. Transmittance values are two orders of magnitude smaller than reflectance values (Figure 2).

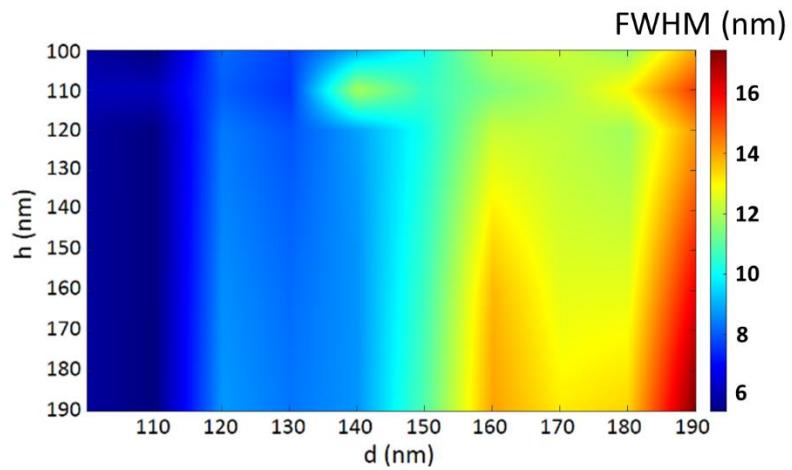

Figure S3. FWHM in nm of the studied Al/polymer 2D plasmonic crystal as a function of the design parameters d and h .

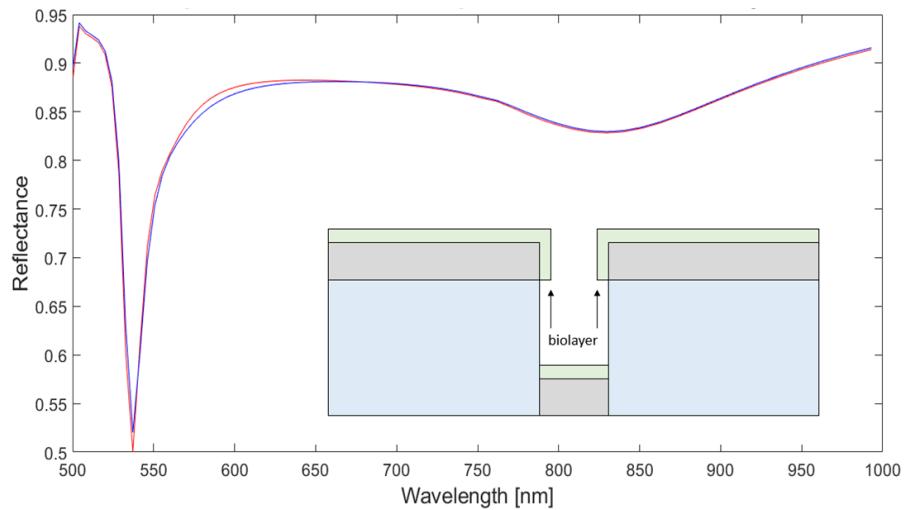

Figure S4. Reflectance spectra of a 500 nm period Al/polymer plasmonic 2D crystal ($d = 150$ nm, $h = 150$ nm) with (blue curve) a 20 nm thick biolayer conformally covering the nanohole Al sidewalls (inset) and without (red curve) such a biolayer sidewall region (Figure 1b). Biolayer sidewall contribution to the sensor performance is negligible.
