Figure S1. The 1600-1500 cm^{-1} band of the standard solutions, depicting the increase in absorbance as a result of the increase in concentration.

Figure S2: Residuals plot of the test set. As the residuals are gathered near zero and have a random pattern, we conclude that the data are fitted in an accurate model, even when the two outliers (in the case of 100 mg tablets) are included.

Figure S3. FTIR spectrum of pure methanol as measured (blue) and with baseline subtraction. A minor contribution of the solvent exists in the 1600–1500 cm^{-1} region.

Table S1: Predicted concentrations of the known samples' solutions (test set).
