OCH ₃	58.0 q	3.32 3H s	-	C-8

^a Signals assignments were based on the results of ^1H – ^1H COSY, HMQC and HMBC experiments. ^b Chemical shift values (δ_{H} and δ_{C}) were recorded using the solvent signals (CD_3OD : δ_{H} 3.31/ δ_{C} 49.0) as references, respectively. ^c The numbers in each line of this column indicate the protons that correlated with the proton in the corresponding line in ^1H – ^1H COSY. ^d The numbers in each line of this column indicate the carbons that showed HMBC correlations with the proton in the corresponding line in the HMBC experiments optimized for the 8.3 Hz of long-range J_{CH} value.

Figure S1. HPLC analysis of **1**, **3**, **4** and **6/7** after treatment in a water-saturated EtOAc at the conditions simulated their extraction conditions.

Each 0.3 mg of the crude compound samples was dissolved in 0.2 mL water-saturated EtOAc in a 0.5 mL Eppendorf tube, capped the tube and kept at room temperature for 6 days, and then further treated at 50 °C for 16 h. These treatment conditions simulated the extraction conditions (whole extraction was achieved within 4 days with a total of 12 h evaporating times at the temperature lower than 40 °C). Then, the aqueous EtOAc was removed by blowing inside of the tube with nitrogen gas to dryness. The residue was dissolved in MeOH and then subjected to HPLC analysis. No any one of them was detected in other compound samples by the HPLC analysis, confirming that none of these compounds are artificial product formed from the others in the extraction conditions.

Column: Capcell MGII 4.6 × 250 nm, Mobile phase: 15% MeOH; Flow rate: 0.8 mL/min; Wavelength: 213 nm.
