## Cytotoxic Assay

Four human cancer cell lines (A549, MCF-7, HepG2, and HL-60 cells), together with one noncancerous cell line, the human bronchial epithelial cells Beas-2B, were used in the cytotoxic activity assay. All cells were cultured in DMEM or RPMI- 1640 medium (HyClone, Logan, UT, USA), supplemented with 10% fetal bovine serum (HyClone) at 37 °C in a humidified atmosphere with 5% CO<sub>2</sub>. The cell survival assay was performed using the MTT method. Briefly, 100 μL of a suspension of the adherent cells was seeded into each well of the 96-well culture plates and allowed to adhere for 12 h before addition of the test compounds. The suspended cells were seeded at an initial density of 1 × 10<sup>5</sup> cells/mL immediately before the addition of the drug. Each tumor cell line was exposed for 48 h in triplicate to the test compounds at concentrations of 0.0625, 0.32, 1.6, 8, and 40 μM, with DDP (cis-platin, Sigma) and paclitaxel as positive controls. After incubation, culture supernatants were removed and exchanged with medium containing 0.5 mg/mL MTT. Then, the cells were incubated for 4 h at 37 °C in darkness, followed by the removal of the medium and adding 100 μL dimethyl sulfoxide. The absorbance at 570 nm was detected and the data were expressed as the mean percentage of absorbance in treated vs. control cells. The value of the control was set at 100%.

**Table S1.** Cytotoxicities against Tumor Cells for **1–8** (IC<sub>50</sub>, μM).

No.	cells	A549	MCF-7	HepG2	HL-60	Beas-2B
<b>1</b>		>40	>40	>40	>40	>40
<b>2</b>		>40	>40	>40	>40	>40
<b>3</b>		>40	>40	>40	>40	>40
<b>4</b>		>40	>40	>40	>40	>40
<b>5</b>		>40	>40	>40	>40	>40
<b>6</b>		>40	>40	>40	>40	>40

## Antifungal Bioassay

The tested pathogenic fungi, *Staphylococcus aureus* (MRSA), methicillin-sensitive *Staphylococcus aureus* (MSSA), *Escherichia coli* and *Pseudomonas aeruginosa*, were provided by Tongji Hospital of Tongji Medical College of Huazhong University of Science and Technology. All samples dissolved in MeOH were tested for antifungal activity in vitro by mycelial growth inhibitory rate method, a *Poison Food Technique*. Potato dextrose agar (PDA) medium was used as the medium for all test fungi.

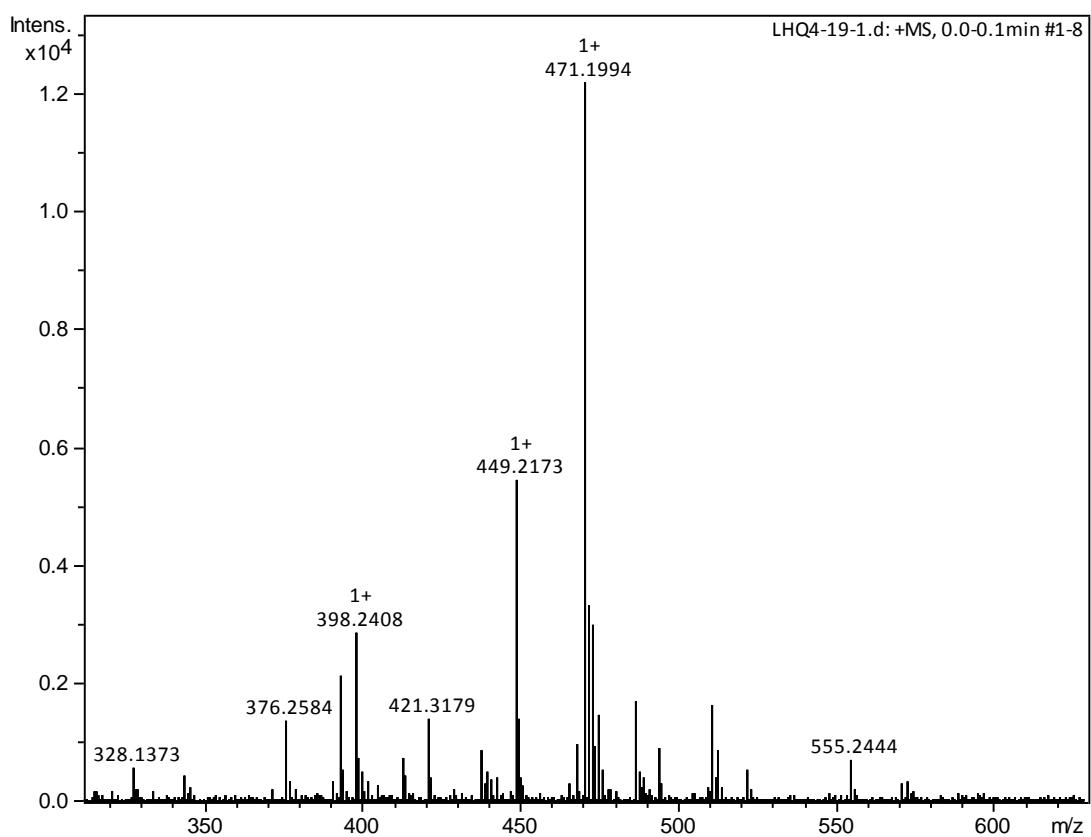

The media (100 ml) incorporating test samples were inoculated at the center of agar discs of the test fungi (4 mm diameter). Three replicate plates for each fungus were incubated at 26 °C for all test fungi. Control plates containing media mixed with MeOH (1 ml) were included. After incubation for 24–48 h, the mycelial growth of fungi (mm) in both treated (T) and control (C) *Petri* dishes was measured diametrically in three different directions (decussation method) until the fungal growth in the control dishes was almost complete. The percentage of growth inhibition (*I*) was calculated using the following formula:

$$I [\%] = (C-T)/C \times 100$$

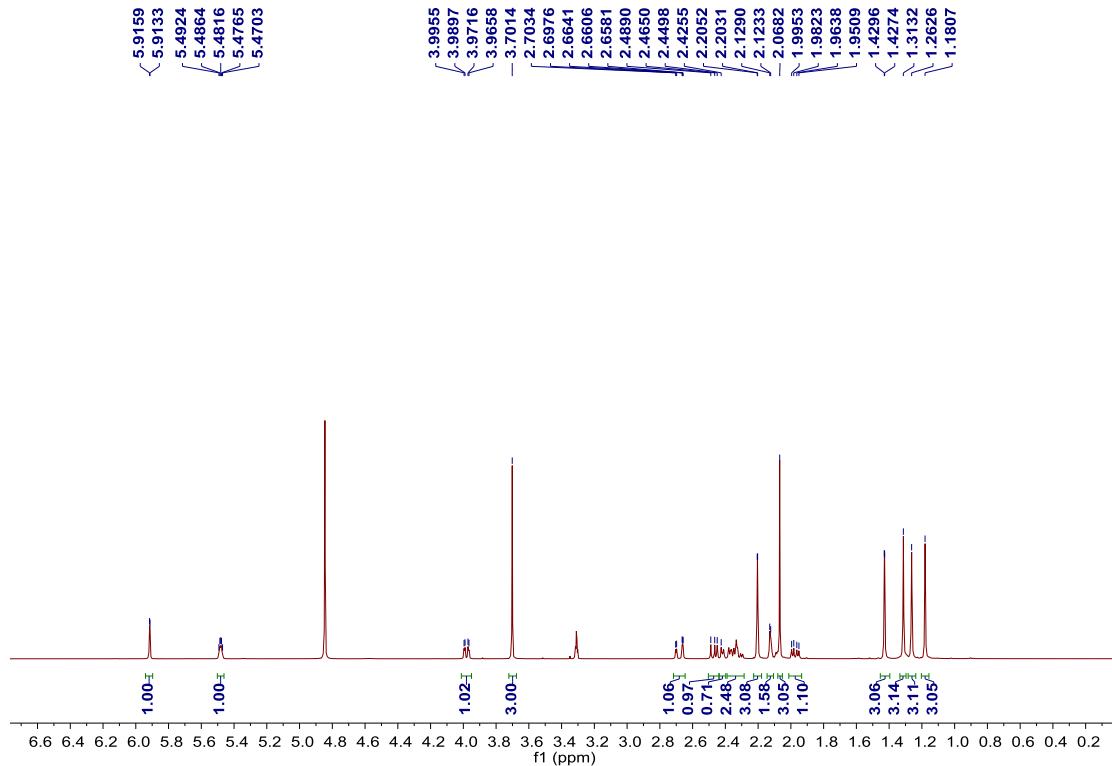

**Table S2.** Antifungal Effects of Compounds **1–8** (MIC,  $\mu\text{g}/\text{ml}$ ).

No.	fungi	MRSA	MSSA	<i>E. coli</i>	<i>P. aeruginosa</i>
<b>1</b>		>100	>100	>100	>100
<b>2</b>		>100	>100	>100	>100
<b>3</b>		>100	>100	>100	>100
