**Table S1.** Meta-analysis for ambient temperature and ischemic stroke (IS).

Temperature Variable Studied	Paper ID	Authors and Year of Publication	Number of IS Cases Reported	Statistical ANALYSIS method	Variables Controlled for in the Model	Overall Conclusion	Comments
Daily mean temperature	2	Dawson 2007	5723	Negative binomial model	Study year, season and day of the week	No statistically significant association	
	3	Feigin 2000	1929	Poisson regression	Age, solar and geomagnetic activity, season	Statistically significant association between colder ambient temperature and first IS occurrence	
	4	Jimenez-Conde 2008	732	Logistic regression	Atmospheric pressure and humidity	No statistically significant association	Non-lacunar stroke

Monthly mean temperature	5	Lee 2008	168977	Auto-regressive integrated moving average analysis	Seasonality, month and trend	No statistically significant association
	8	Han 2015	2202	Poisson generalized linear regression	Temperature range, humidity, PM <sub>10</sub> and NO <sub>2</sub>	Statistically significant association between warmer temperature and IS risk
Daily minimum temperature	2	Dawson 2007	5723	Negative binomial model	Study year, season and day of the week	No statistically significant association
	6	Magalhaes 2011	348	Poisson regression	Not reported	Statistically significant association between colder temperature and IS risk
Daily maximum temperature	2	Dawson 2007	5723	Negative binomial model	Study year, season and day of the week	No statistically significant association
	6	Magalhaes 2011	348	Poisson regression	Not reported	Statistically significant association between colder temperature and IS risk

**Table S2.** Studies included in systematic review of mean temperature and ischemic stroke (IS).

Paper ID	Authors and Year of Publication	Number of IS Cases Reported	Temperature Variable Studied	Statistical Analysis Method	Variables Controlled for in the Model	Overall Conclusion
21	Goggins 2012	107505	Daily mean temperature (lag 0–13 days)	Poisson generalized additive models	Humidity, solar radiation, rainfall, air pressure, pollutants, flu consultation rates, day of week, holidays, time trend and seasonality	Statistically significant association between colder temperature and IS risk for below 22 °C temperature
17	Sobel 1987	1306	Monthly mean temperature	Pearson correlation	N/A	Statistically significant association between colder temperature and IS risk
18	Tsementzis 1991	434	Monthly mean temperature	Linear regression	Humidity, pressure, rain, and sunshine	Statistically non-significant association between colder temperature and IS risk
3	Feigin 2000	1929	Daily mean temperature: low ( $\leq -2.0$ °C), mild ( $-1.9$ to $7.2$ °C) vs. high ( $\geq 7.3$ °C, reference variable)	Poisson regression	Season, geomagnetic, sun activity, and age	Statistically significant association between colder temperature and first IS risk

**Table S3.** Studies included in systematic review of mean temperature and ischemic stroke (IS) by sex.

Paper ID	Authors and Year of Publication	Number of IS Cases Reported	Temperature Variable Studied	Statistical Analysis Method	Variables Controlled for in the Model	Overall Conclusion
14	Matsumoto 2010	290	Daily mean temperature	Multilevel logistic regression	Age, obesity, current smoking status, total cholesterol, systolic blood pressure, diabetes, and other meteorological parameters (including rainfall and sunlight)	Among women, statistically significant association between colder temperature and IS risk
16	Shinkawa 1990	223	Monthly mean temperature	Stepwise multivariate regression	Not reported	Among women, statistically significant association between colder temperature and IS risk
8	Han 2015	2202	Monthly mean temperature	Poisson generalized linear regression	Temperature range, humidity, PM <sub>10</sub> and NO <sub>2</sub>	Among men, statistically significant association between warmer temperature and IS risk
21	Goggins 2012	107505	Daily mean temperature (lag 0-13 days)	Poisson generalized additive models	Humidity, solar radiation, rainfall, air pressure, pollutants, flu consultation rates, day of week, holidays, time trend and seasonality	Statistically significant association between colder temperature and IS risk below 22°C for both sex, however the association was stronger for female sex

**Table S4.** Studies included in systematic review of ambient temperature and ischemic stroke (IS) by age.

Paper ID	Authors and Year of Publication	Number of IS Cases Reported	Temperature Variable Studied	Statistical Analysis Method	Variables Controlled for in the Model	Overall Conclusion
19	Wang 2009	6743	Daily maximum and minimum temperature	Generalized estimating equations (GEE) model	Humidity and air pollutants including PM <sub>10</sub> , NO <sub>2</sub> , O <sub>3</sub> and SO <sub>2</sub>	For aged≥65 in winter, statistically significant association between colder maximum temperature and IS admission
8	Han 2015	2202	Monthly mean temperature	Poisson generalized linear regression	Temperature range, humidity, PM <sub>10</sub> and NO <sub>2</sub>	For aged≥60, statistically significant association colder temperature and IS risk
21	Goggins 2012	107505	Daily mean temperature (lag 0-13 days)	Poisson generalized additive models	Humidity, solar radiation, rainfall, air pressure, pollutants, flu consultation rates, day of week, holidays, time trend and seasonality	As age increases, the association between colder temperature and IS risk becomes stronger, there was a particularly large jump in relative risk for those aged >85

**Table S5.** Studies included in systematic review of temperature change and ischemic stroke (IS).

Paper ID	Authors and Year of Publication	Number of IS Cases Reported	Temperature Variable Studied	Statistical Analysis Method	Variables Controlled in the Model	Overall Conclusion
2	Dawson 2007	5723	Daily change in mean temperature over preceding 24 h and 48 h	Negative binomial model	Study year, season and day of the week	Every 1 °C increase in mean temperature during the preceding 24 h was significantly associated with a 2.1% increase in IS admissions
3	Feigin 2000	1929	Any change towards increasing or decreasing mean temperature vs. no change,	Poisson regression	None (univariate model)	No statistically significant association
11	Gomes 2014	351	Daily maximum decrease in minimum temperature ≥2.4 °C vs. <2.4 °C	Conditional logistic regression	Humidity and precipitation	No statistically significant association

6	Magalhaes 2011	348	Diurnal temperature range in previous 24 h, 7 and 14 days	Poisson regression	Not reported	No statistically significant association
7	Morabito 2011	45787	Temperature difference in previous 24 h	Generalized linear model	Years, seasons, days of the week, celebrations, summer decrement of population	Statistically significant association between larger change and IS risk
8	Han 2015	2202	Diurnal temperature range (monthly)	Poisson generalized linear regression	Temperature range, humidity, PM <sub>10</sub> and NO <sub>2</sub>	No statistically significant association
4	Jimenez-Conde 2008	1043	Variations of mean, minimum, and maximum temperature in previous 24 h	Logistic regression	Atmospheric pressure, humidity	No statistically significant association

**Table S6.** Meta analysis for mean temperature and intracerebral hemorrhage (ICH).

Paper ID	Authors and Year of Publication	Number of ICH Cases Reported	Statistical Analysis Method	Variables Controlled in the Model	Overall Conclusion
2	Dawson 2007	666	Poisson regression	Study year, season and day of the week	No statistically significant association
3	Feigin 2000	215	Poisson regression	None	No statistically significant association
4	Jimenez-Conde 2008	243	Logistic regression	Atmospheric pressure, humidity	No statistically significant association
8	Han 2015	799	Poisson generalized linear regression	Temperature range, humidity, PM <sub>10</sub> and NO <sub>2</sub>	No statistically significant association
7	Morabito 2011	12478	Poisson generalized linear model	Years, seasons, days of the week, celebrations, summer decrement of population	Statistically significant association between colder temperature and ICH risk

**Table S7.** Studies only included in systematic review of mean temperature and intracerebral hemorrhage (ICH).

Paper ID	Authors and Year of Publication	Number of ICH Cases Reported	Weather Parameter Studied	Analysis Model	Variables Controlled	Overall Conclusion
9	Chen 1995	170	Daily mean temperature (>27.3 °C; 17.3–27.3 °C; <17.3 °C)	Linear regression model	Atmospheric pressure	Statistically significant association between colder temperature and ICH risk
16	Shinkawa 1990	51	Monthly mean temperature	Multiple linear regression	Not reported	Statistically significant association between colder temperature and ICH risk
17	Sobel 1987	130	Monthly mean temperature	Pearson correlation	N/A	Statistically significant association between colder temperature and ICH risk
10	Fang 2012	933	Monthly mean temperature and temperature range	Linear regression model	Not reported	Statistically significant association between colder temperature and ICH risk
3	Feigin 2000	215	Daily mean temperature: low (<-2.0 °C), mild (-1.9 to 7.2 °C) vs. high (>7.3 °C)	Poisson regression	Season, geomagnetic, sun activity, and age	Statistically significant association between ICH occurrence and mild ambient temperature
6	Magalhaes 2011	91	Daily minimum and maximum temperature in previous 7 and 14 days	Poisson regression	Not reported	No statistically significant negative association
15	Nakaguchi 2008	164	Daily maximum and minimum temperature	Mann-Whitney's U-test		ICH tends to occur on days with lower maximum air temperature.
19	Wang 2009	1835	Daily maximum and minimum temperature	Generalized estimating equations (GEE) model	Humidity, PM <sub>10</sub> , NO <sub>2</sub> , O <sub>3</sub> and SO <sub>2</sub>	Statistically significant association between colder temperature with maximum temperature
4	Jimenez-Conde 2008	243	Mean, maximum and minimum temperature	Logistic regression	Atmospheric pressure and humidity	No statistically significant association

**Table S8.** Studies included in systematic review of mean temperature and intracerebral hemorrhage (ICH) by sex.

Paper ID	Authors and Year of Publication	Number of ICH Cases Reported	Weather Parameter Studied	Analysis Model	Variables Controlled	Overall Conclusion
14	Matsumoto 2010	102	Daily mean temperature	Multilevel logistic regression	Age, obesity, smoking status, total cholesterol, systolic blood pressure, diabetes, and other meteorological parameters	Statistically significant association between colder temperature and ICH risk among females but not males
16	Shinkawa 1990	51	Monthly mean temperature	Stepwise multivariate analysis	Not reported	Statistically significant association between colder temperature and ICH risk among males but not females
8	Han 2015	799	Monthly mean temperature	Poisson generalized linear regression	Temperature range, humidity, PM <sub>10</sub> and NO <sub>2</sub>	No statistically significant association

**Table S9.** Studies included in systematic review of ambient temperature and intracerebral hemorrhage (ICH) by age.

Paper ID	Authors and Year of Publication	Number of ICH Cases Reported	Weather Parameter Studied	Analysis Model	Variables Controlled	Overall Conclusion
19	Wang 2009	1835	Daily maximum and minimum temperature	Generalized estimating equations (GEE) model	Humidity and air pollutants	Statistically significant association between ICH risk and colder maximum temperatures in patients aged ≥65 and for patients <65 in summer
7	Morabito 2011	12478	Daily mean temperature	Poisson generalized linear model	Years, seasons, days of the week, celebrations, summer decrement of population	Statistically significant association between colder temperature and ICH risk among patients ≥65
8	Han 2015	799	Monthly mean temperature	Poisson generalized linear regression	Temperature range, humidity, PM <sub>10</sub> and NO <sub>2</sub>	Statistically significant association between colder temperature and ICH risk among aged ≥60

**Table S10.** Studies included in systematic review of temperature change and intracerebral hemorrhage (ICH).

Paper ID	Authors and Year of Publication	Number of ICH Cases Reported	Weather Parameter Studied	Analysis Model	Variables Controlled	Overall Conclusion
10	Fang 2012	933	Monthly temperature fluctuation	Linear regression model	None	Statistically significant association between larger change and ICH risk
3	Feigin 2000	215	Daily change in mean temperature towards increasing or decreasing vs. no change	Poisson regression	Season, geomagnetic, sun activity, and age	No statistically significant association
11	Gomes 2014	242	Daily maximum decrease in minimum temperature $\geq 2.4$ °C vs. $< 2.4$ °C	Conditional logistic regression	Humidity and precipitation	Statistically significant association between larger change and ICH risk
6	Magalhaes 2011	91	Diurnal temperature range in previous 24 h, 7 and 14 days	Poisson regression	N/A	Statistically significant association with larger temperature range in the previous 24 h
16	Shinkawa 1990	51	Intradiurnal temperature	Stepwise multivariate analysis	Not reported	Statistically significant association between larger change and ICH risk
8	Han 2015	799	Diurnal temperature range	Poisson generalized linear regression	Temperature range, humidity, PM <sub>10</sub> and NO <sub>2</sub>	No statistically significant association
7	Morabito 2011	12478	Temperature change in the previous 24 h	Poisson generalized linear model	Years, seasons, days of the week, celebrations, summer decrement of population	No statistically significant association
4	Jimenez-Conde 2008	243	Mean, maximum and minimum temperature variation in the previous 24 h	Logistic regression	Atmospheric pressure and humidity	No statistically significant association

**Table S11.** studies for mean temperature and subarachnoid hemorrhage (SAH).

Paper ID	Authors and Year of Publication	Number of SAH Cases Reported	Temperature Variable Studied	Statistical Analysis Method	Variables Controlled in the Model	Overall Conclusion
1	Abe 2008	1729	Hourly mean temperature	Autoregressive integrated moving average model	Atmospheric pressure, humidity	Statistically significant association between colder temperature and SAH risk
3	Feigin 2000	64	Daily mean temperature	Poisson regression	Season, geomagnetic, sun activity, and age	No statistically association
12	Lai 2014	16970	Daily mean temperature	Linear regression	Sex	Statistically significant association between warmer temperature and SAH risk
20	Oyoshi 1999	210	Monthly mean, maximum, minimum temperature	Pearson correlation	N/A	No statistically significant association
18	Tsementzis 1991	430	Monthly mean temperature	Linear regression	Humidity, pressure, rain, and sunshine	No statistically significant association

**Table S12.** Studies included in systematic review of ambient temperature and subarachnoid hemorrhage (SAH).

Paper ID	Authors and Year of Publication	Number of SAH Cases Reported	Temperature Variable Studied	Statistical Analysis Method	Variables Controlled in the Model	Overall Conclusion
3	Feigin 2000	64	Low (<-2.0), mild (-1.9 to 7.2) vs. high (>7.3) mean temperature. Any change towards increasing or decreasing vs. no change,	Poisson regression	Season, geomagnetic, sun activity, and age	No statistically significant association
13	Lejeune, 1994	283	Reduction of 1 of maximal temperature on the day of SAH; reduction of 1 of maximal temperature on the day before SAH	Logistic regression	Atmospheric pressure, humidity and sunshine duration	Statistically significant association between larger temperature change and SAH risk
