

Figure S1: Physico-chemical parameters of organochlorines ($n=30$) predicted to display low or high intestinal absorption. S, statistically significant ($p<0.05$); NS, not statistically significant ($p>0.05$). Statistical analysis was performed with the unpaired Student's t test, excepted for the number of H-bond donors for which the Mann-Whitney test was used (due to the fact that unpaired Student's t test was not applicable because all the values for predicted low-permeant organochlorines are identical).
