Supplementary data

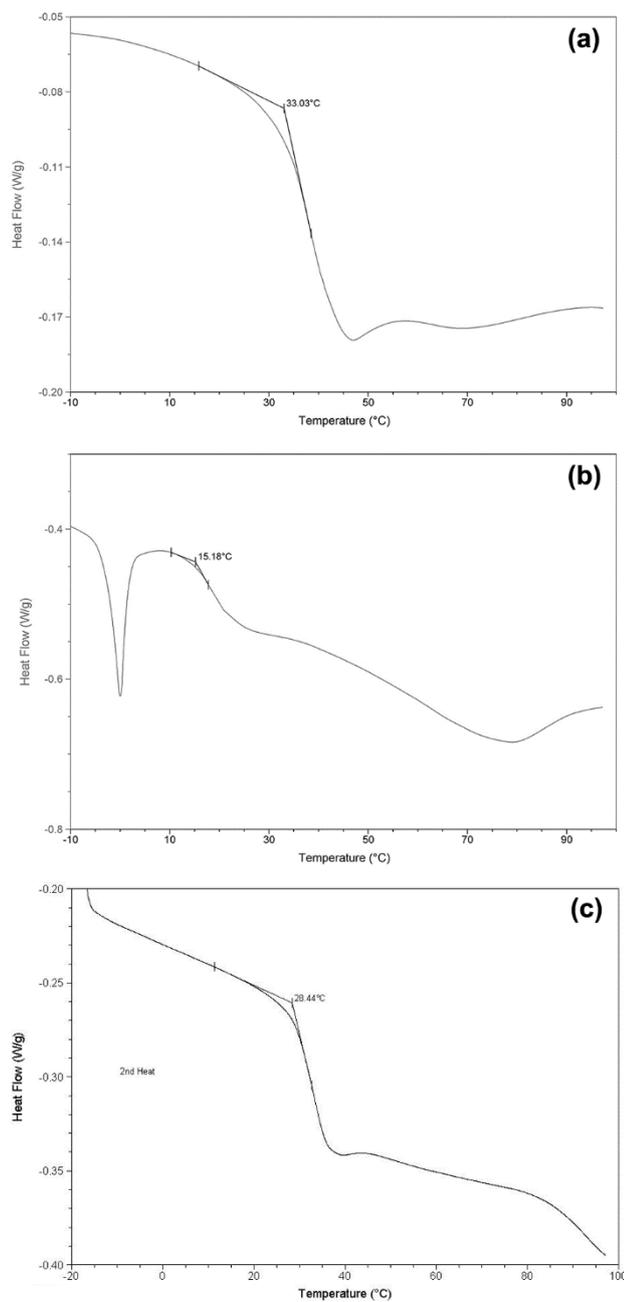

Figure S1: DSC curves for (a) PLA, (b) PLA/CS-EO, (c) PLA/BP-EO electrospun fibres.

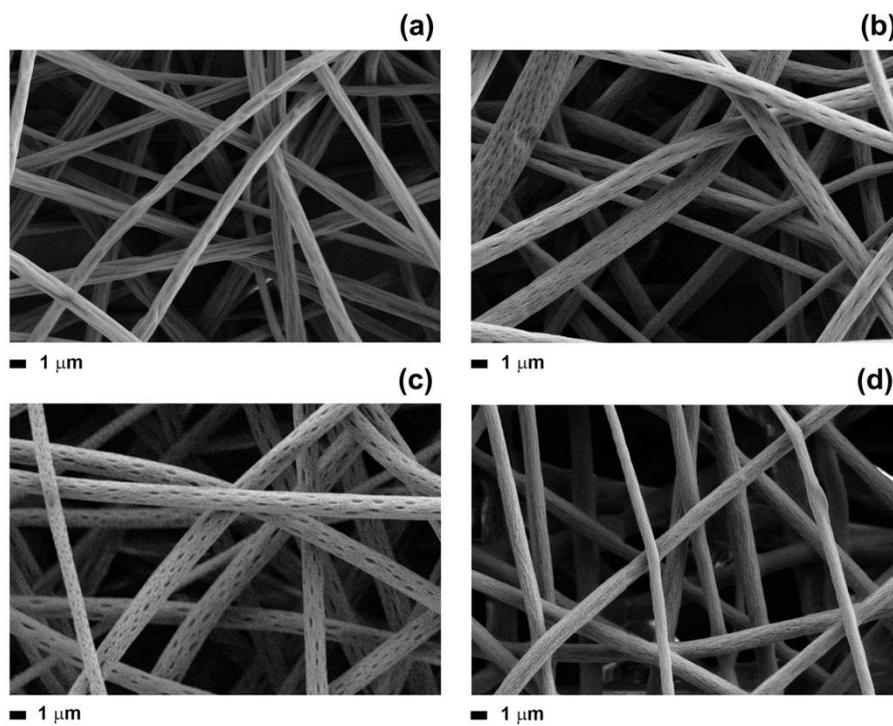

Figure S2. FEGSEM images of PLA/BP-EO fibres containing (a) 5.0% *v/v*, (b) 7.5% *v/v*, (c) 10.0% *v/v* and (d) 15.0 *v/v* of BP essential oil.

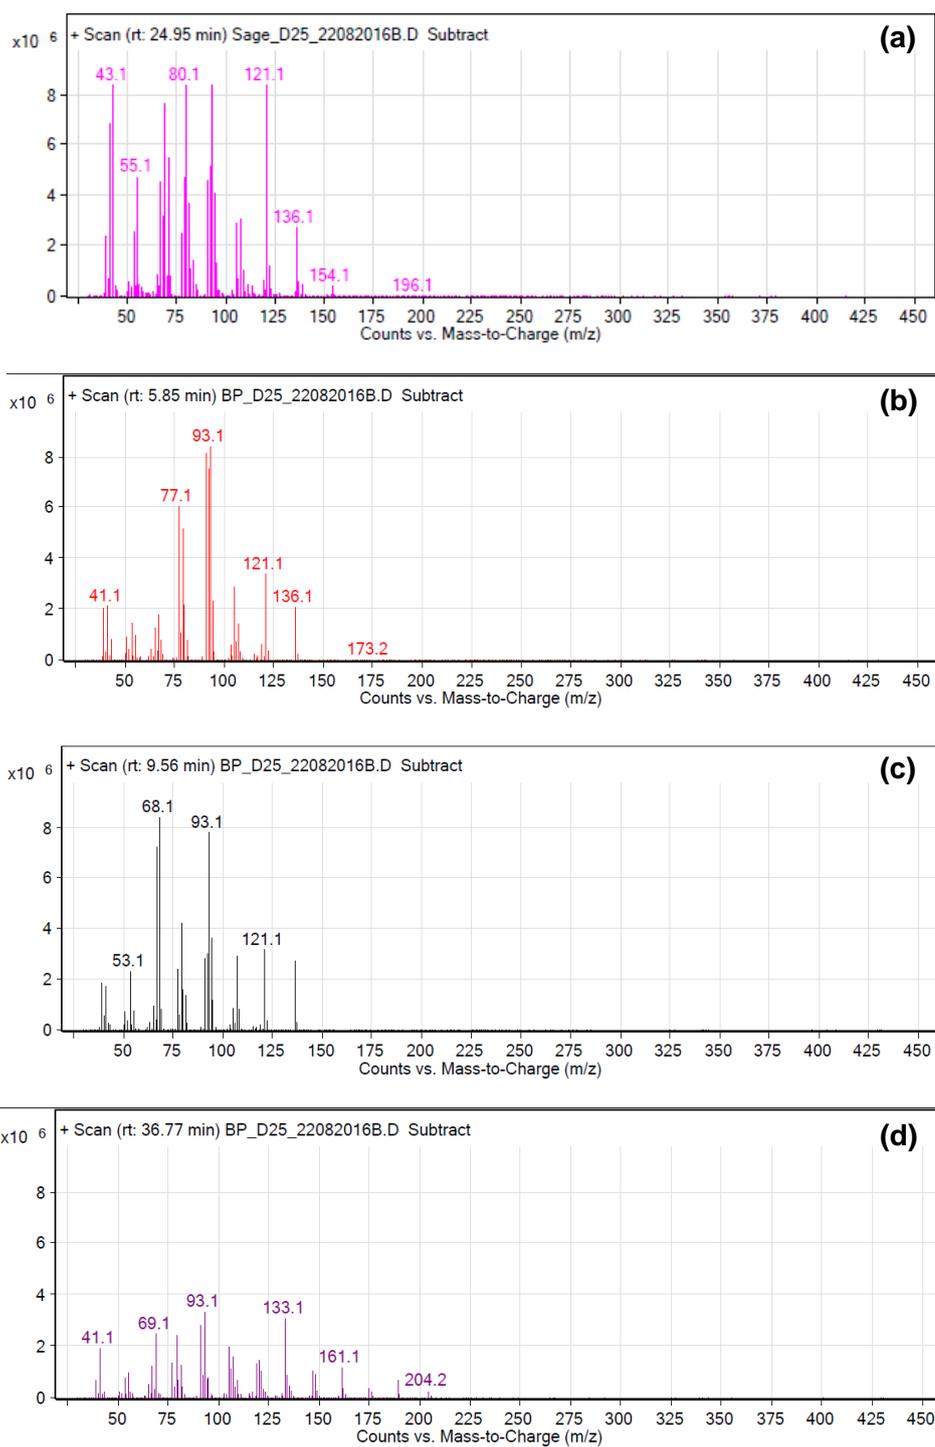

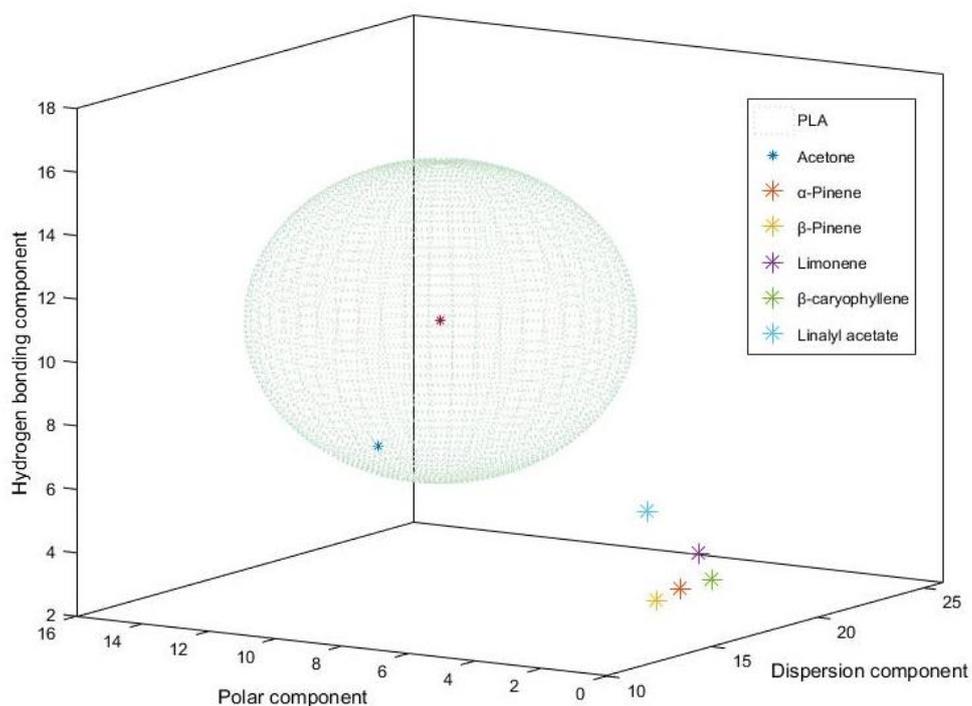

Figure S3. Mass spectra of (a) linalyl acetate, (b) α -pinene, (c) limonene and (d) β -caryophyllene.

Table S1. Properties of the chemicals used in this study.

Compound	Vapour			Hansen Solubility Parameter				
	Pressure	Boiling	Retention	(MPa) ^{1/2} **				
	(at 20 °C) [mmHg]	Point [°C]	Index*	δ_d	δ_p	δ_h	δ_t	
PLA	-	-	-	15.8	8.7	11.1	21.1	
Acetone	184.000	56	-	15.5	10.4	7.0	19.9	
Black pepper oil	α -Pinene	4.500	155	0941	17.3	2.4	3.1	17.7
	β -Pinene	2.300	165	0980	17.1	3.0	2.7	17.6
	Limonene	3.300	176	1031	17.2	1.8	4.3	17.8
	β -Caryophyllene	0.003	255	1467	16.9	1.2	3.6	17.3
Sage oil	Linalyl acetate	0.005	220	1261	14.3	1.5	6.2	15.6

* Retention Index, also called Kovats retention index, is an index to compare the volatility of materials.

** Hansen solubility parameter (δ_d -dispersion component, δ_p -polar component, δ_h -hydrogen bonding component) can be combined by the equation: $\delta_t^2 = \delta_d^2 + \delta_p^2 + \delta_h^2$. The total solubility parameter δ_t , corresponds to the total Hildebrand solubility parameter.

**Figure S4.** Hansen space obtained using MATLAB software.

Based on the figure, the centre of the sphere is the Hansen solubility parameter of PLA; the sphere is considered as the soluble region of PLA. If the solubility parameter of any solvent is located inside the Hansen sphere, that solvent is a good solvent for PLA; otherwise, the solvent cannot dissolve the polymer.
