

1 SUPPLEMENTARY INFORMATION

2 SUPPLEMENTARY FIGURES

3 Figure S1

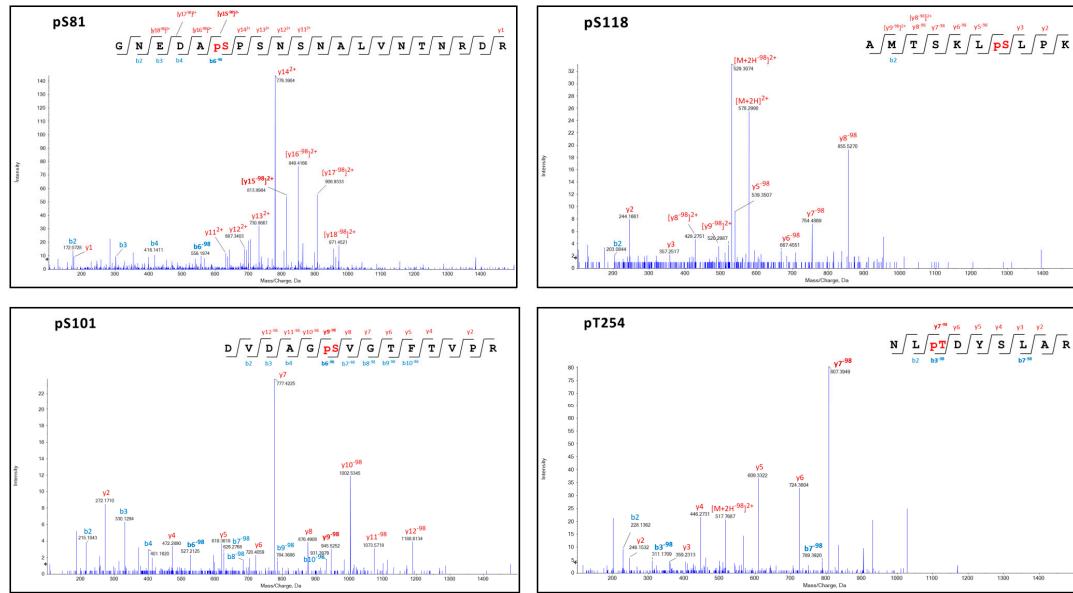

4

5 Schematic representation of PPV full-length cDNA clones. Sequences of C-terminal region
6 of PPV-R and PPV-SwCM CPs are displayed below corresponding constructs. Mutations
7 engineered into the casein kinase II (CK2) motif (yellow background) in constructs pICPPV-
8 NK-IGFP and pICPPV-CPSwCM-R are shown in red.

9

10 **Figure S2**

11

12

13 MS/MS fragmentation spectra identifying phosphorylations at S81, S101, S118 and T254
 14 in the capsid protein of PPV-R virions purified from *Prunus persica* plants. Details of
 15 identified phospho-peptides are provided in Supplementary Table S3.

18

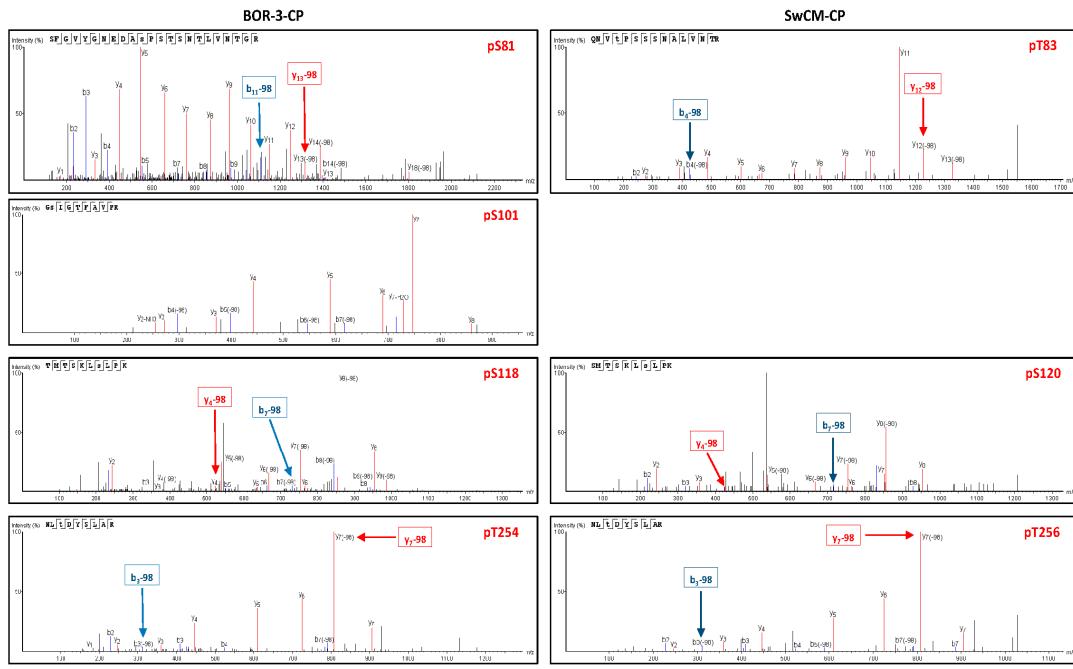

19 **Supplementary Figure S3:** Alignment of coat protein (CP) sequences from representative isolates of the ten strains proposed for *Plum pox virus* (PPV). Respective strains are in parentheses. Accession numbers for the aligned sequences are: R, EF569215; BOR-3, AY028309; SwCM, sequence not deposited in a public repository; RU-30sc, KC020126; Tat-4, MF447180; LV-145bt, HQ670748; El Amar, AM157175; Ancestor, HF674399; SK-111pl, HF585099; AbTk, EU734794. Residues in which phosphorylations (red) and O-

25 GlcNAcylations (blue) had been previously identified in the CP of PPV-R virions [1-4], as
26 well as the equivalent residues, potentially modifiable in other isolates, are highlighted.
27 Amino acids found phosphorylated just in the CP of BOR-3 (pS62) and SwCM (pT306) are
28 highlighted in orange. Casein kinase II (CK2) motif, largely conserved among potyviruses,
29 is shown on a yellow background. Proteins were aligned using Clustal Omega program
30 (*European Bioinformatics Institute*).

31

32 **Figure S4**

33

34

35 MS/MS fragmentation spectra showing phosphorylations in the coat protein (CP) of PPV-BOR-3 (BOR-3-CP) and PPV-SwCM (SwCM-CP) virions. Details of phospho-peptides corresponding with these spectra are provided in Table 1.
 36
 37

38

39 Figure S5

41 Alignment of coat protein (CP) sequences from the *Plum pox virus* (PPV) isolate PPV-R
42 (EF569215) and *Potato virus A* (CAC17411). Residues in which phosphorylations (red) and
43 O-GlcNAcylations (blue) had been identified in the CP of PPV-R virions [1-4] are
44 highlighted. Amino acids equivalents to those residues found phosphorylated in the CPs
45 of PPV-BOR3 and PPV-SwCM (see Figure S3) are highlighted in orange. Casein kinase II
46 (CK2) motif, largely conserved among potyviruses, is shown on a yellow background.
47 Proteins were aligned using Clustal Omega program (*European Bioinformatics Institute*).

50

51 Alignment of partial sequences of the coat protein (CP) from 79 potyvirus species. Aligned
 52 fragment spans from amino acids 282 to 329 of the CP of *Plum pox virus*. Casein kinase II
 53 (CK2) motif is highlighted with yellow background. Residues aligning with amino acid T243
 54 of PVA CP are in red font. Amino acids numbering refers to the sequence of PPV-R.
 55 Proteins were aligned using the Clustal Omega software (*European Bioinformatics
 56 Institute*).

					Peaks	>50

90

91 Summary of confident peptides and their phosphorylated sites identified by LC-MS/MS,
 92 from two biological replicates. MS/MS spectra identifications were carried out by using
 93 Mascot and Peaks search engines, considering specified confident threshold scores,
 94 although manual validation was also performed. Data are available via ProteomeXchange
 95 with identifier PXD017780.

96 ^a Both post-translational modifications, phosphorylation and O-GlcNAcylation, are
 97 unambiguously detected in the identified peptide 1-39. However, y/b fragment ions
 98 assigning these modifications to specific residues could not be found. Phosphorylation at
 99 S25 (in green) is guessed on basis to previous results with virions purified from *Nicotiana*
 100 *benthamiana* plants, but phosphorylation in S16 or T19 cannot be ruled out. O-
 101 GlcNAcylation targeted one of these residues: S16, T24 or S25.

102 ^b Residues definitively found modified by phosphorylation are shown in red (see MS/MS
 103 fragmentation spectra in Supplementary Figure S2).

104

105 **Table S4**

106 **Table S4.** Summary of phosphorylations affecting the coat protein (CP) of different *Plum*
107 *pox virus* isolates, and in different hosts

Plant host	Strain Isolate	Specific residues in PPV-R CP									
		pS25	pS62	pT71	pS81	pS101	pT106	pS118	pT254	pT304	pT313
<i>Nicotiana spp.</i>	D R	M	N.D.	M	M	M	M	M	M	N.D.	M
	Rec BOR-3	N.A.	M	N.D.	M	M	N.D.	M	M	N.D.	N.D.
	Cherry SwCM	-	N.A.	N.D. (S73)	M (pT83)	N.D. (T103)	N.D. (S108)	M (pS120)	M (pT256)	M (pT306)	N.D. (T315)
<i>Prunus persica</i>	D R	?	-	N.D.	M	M	N.D.	M	M	N.D.	-

108

109 (M) phosphorylation mapped; (?) phosphorylation detected but not unambiguously
110 assigned to that specific position; (N.D.) not detected phosphorylation; (N.A.) not
111 applicable; (-) corresponding peptide not generated. Residues in the CP of the SwCM
112 isolate in listed positions of R isolate are shown in brackets.

113

114 **Table S5**

115 **Table S5.** Infectivity of *Plum pox virus* mutants affected in putative phospho-target at the
116 casein kinase II motif of the capsid protein (CP)

Inoculum ^a	Clone ^a	Infected / inoculated plants ^b
R-T304A	1	2/3
	2	2/3
R-T304D	1-1	3/3
	1-2	2/3
R-T304N	1	2/3
	2	2/3
R	1	3/3
	2	2/3
SwCM-T306A	1-1	4/4
	1-2	4/4
SwCM-T306D	1	2/4
	2	3/4
SwCM-T306N	1	4/4
	2	2/4
CPSwCM-R	1	4/4

117

118 ^a *Nicotiana benthamiana* plants were manually inoculated with the DNA of indicated
119 plasmids. Two independent clones per construct were used, except in the case of mutants
120 R-T304D and SwCM-T306A for which two DNA preparations from a single clone were
121 used.

122 ^b Infectivity was estimated at 21 days post infection, based on CP detection by Western
123 blot analysis and IC-RT-PCR amplification of the viral RNA.
