¹ RI8: Recognition of Rev-RI8 peptide: y=yes, n=no, ² controller #1 at the day of the ELISPOT analysis with freshly isolated PBMCs (Figure 1), ³ same values as current values as #1 was untreated. ⁴ data not available. Pre-ART: last value before start of antiretroviral treatment. Statistical analysis by Mann-Whitney-U-Test revealed significant higher pre-ART CD4 counts in subjects with recognition of Rev-RI8 in comparison to subjects without recognition of Rev-RI8 ($p=0.012$ with inclusion subject #1 and $p=0.0290$, if #1 is omitted). There were no significant differences between Rev-RI8 responders and non-responders regarding current CD4 counts, current and pre-ART CD8 counts and viral loads, respectively ($p=n.s.$).

Supplementary Table S3. Sequence variants of the Rev-RI8 epitope within different HIV-1 subtypes.

Indicated are Rev-RI8 epitope sequences from different HIV-1 subtypes obtained from the Los Alamos HIV Sequence Compendium 2019 [19]. Dashes indicated identical amino acids as in the Rev-RI8 epitope. Amino acids letters indicate the sequence variation within the Rev-RI8 epitope. n= frequency of the indicated sequences as presented in the sequence compendium.

Supplementary Table S4. Analysis of sequence variation within the Rev-RI8 epitope.

HIV-1 subtype	n	R	Q	R	Q	I	R	S	I
A	15	0	0	4	1	1	15	0	3
B	15	1	0	0	5	0	7	9	4
C	15	2	1	5	2	2	12	3	3
D	10	1	0	0	1	1	9	1	2
F	10	0	0	0	0	2	0	10	1
G	9	0	0	0	0	0	6	1	0
01-AE	10	1	0	0	1	1	3	9	3
02-AG	9	0	0	1	1	0	4	9	1

Indicated are the number of amino acid variations within the different HIV-1 subtypes for each amino acid position of the Rev-RI8 epitope. The sequences were obtained from the Los Alamos HIV Sequence compendium 2019 [19]. n= number of sequences for each subtype.
