Supplemental Material for

Predicting Vaccine Effectiveness for Hospitalization and Symptomatic Disease for Novel SARS-CoV-2 Variants Using Neutralizing Antibody Titers

Billy J. Gardner and A. Marm Kilpatrick

Table S1. Fold reductions or inverse of neutralizing antibody titers relative to wild-type virus ($1/NATR_{var}$). Comparisons that were not made in the Reference are denoted with a "-".

Ref.	Alpha	Gamma	Delta	Beta	BA.1	BA.2	BA.4/5	BA.1 (Dec. 2021)

Table S2. The fitted model for the fold-reduction ln(1/NATRvar) in neutralizing antibody titers for virus variants relative to WT with variant as a fixed effect and study as a random effect. Alpha was the reference level; the standard deviation of the random effect, study, was 0.51.

Predictor	Estimate	SE	t-value	P-value
Alpha (Intercept)	0.45	0.16	2.75	0.0087
Gamma	0.32	0.16	2.05	0.048
Delta	0.37	0.23	1.63	0.11
Beta	1.37	0.15	9.26	<0.001
BA.1	2.47	0.22	11.06	<0.001
BA.2	2.17	0.29	7.49	<0.001
BA.4/5	2.54	0.31	8.25	<0.001
BA.1 Dec. 2021	3.22	0.49	6.63	<0.001

Table S3. Estimates of fold-reduction (1/NATR$_{var}$) in neutralizing antibody titers for virus variants relative to WT with 95% CIs.

Variant	Fold Reduction (95% CI)
Alpha	1.57 (1.14-2.16)
Gamma	2.15 (1.55-2.99)
Delta	2.27 (1.45-3.55)
Beta	6.17 (4.58-8.30)
BA.1	18.5 (12.8-26.7)
BA.2	13.6 (8.3-22.4)
BA.4/5	19.9 (11.6-34.1)
BA.1 (Dec. 2021)	39.1 (16.0-96.0)

Table S4. Vaccine effectiveness against symptomatic disease estimates used to fit the VE-NATR$_{tot}$ model and shown in Figure 2A.

Variant	Ref.	Vaccine	VE	95% CI	Effective cases vaccine group	Effective cases control group
Alpha	[31]	BNT162b2	0.97	0.97-0.97	30	1000[a]

Table S8. VE validation data for the Omicron variant shown in Figure 3 for two vaccines, two endpoints, and two immune statuses (two-dose waned and boosted with a third dose).

Ref.	Vaccine	Dose	Endpoint	VE	CI	Est. cases vaccine group	Est. cases control group
[53]	mRNA-1273	Three-dose boosted	Hospitalization	97.5	96.3 - 98.3	25.9	1037
[54]	BNT162b2	Two-dose waned	Hospitalization	51.6	47.2 - 55.6	776.8	1604.9
[54]	BNT162b2	Three-dose boosted	Hospitalization	88.8	87.3 - 90.1	273.1	2438.4
[54]	mRNA-1273	Three-dose boosted	Hospitalization	90.2	87.3 - 92.5	60.7	618.9

[55]	BNT162b2	Two-dose waned	Hospitalization	34.9	17.7 - 48.4	116.2	178.5
[56]	BNT162b2	Two-dose waned	Symptomatic disease	8.8	7 - 10.5	20033.7	21966.8
[56]	BNT162b2	Three-dose boosted	Symptomatic disease	67.2	66.5 - 67.8	12151	37045.9
[56]	mRNA-1273	Two-dose waned	Symptomatic disease	14.9	2.9 - 24.7	426.3	500.9
[56]	mRNA-1273	Three-dose boosted	Symptomatic disease	66.3	63.7 - 68.8	902.5	2678
Figure S1. VE against hospitalization by vaccine plotted against variant-specific reductions in neutralizing antibody titers relative to WT virus. Each point (and 95% CI) represents a single estimate of VE for a single vaccine & virus variant from an observational study. Points have been slightly jittered along the x-axis to facilitate presentation.
Figure S2. VE against symptomatic disease by vaccine plotted against variant-specific reductions in neutralizing antibody titers relative to WT virus. Each point (and 95% CI) represents a single estimate of VE for a single vaccine & virus variant from an observational study. Points have been slightly jittered along the x-axis to facilitate presentation.
Figure S3. Comparison of estimated VE for the Omicron variant and Delta variants for two endpoints, two vaccines, and two immune statuses (6+ months after two doses (Waned) and shortly after a 3rd dose (Boosted)).
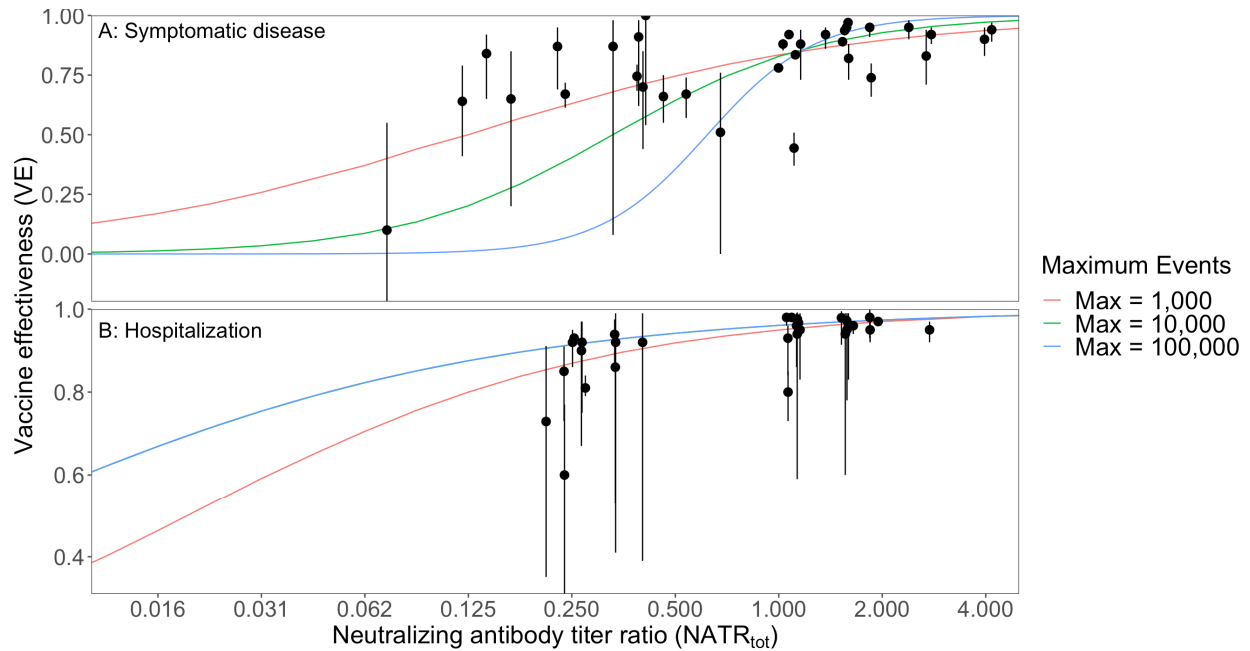

Figure S4. Illustration of the effect of large studies on the fitted relationship between VE and $NATR_{tot}$. Vaccine Effectiveness (VE) is plotted against variant- and vaccine-specific neutralizing antibody titer ratios ($NATR_{tot}$) for (A) symptomatic disease and (B) hospitalization. Each point (and 95% CI represents a single empirical estimate of VE for a single vaccine & virus variant. Points are jittered slightly along the x-axis to facilitate presentation. Each line shows the fitted model using a different maximum value for events (symptomatic cases or hospitalizations) in the control group, corresponding to a different maximum weight given to any one data point. When the maximum value is 10,000 or 100,000, a few points at high $NATR_{tot}$ with very large sample sizes distort the relationship leading to a poor fit at low $NATR_{tot}$.
Figure S5. Vaccine effectiveness and 95% CIs for each study (circles) and generated using estimated infections in each arm of each study (triangles), which were not reported in most studies. Upper CIs are shown in red and lower CIs are shown in blue.
