

# Supplementary Materials: Quantitative Cryo-TEM Reveals New Structural Details of Doxil-Like PEGylated Liposomal Doxorubicin Formulation

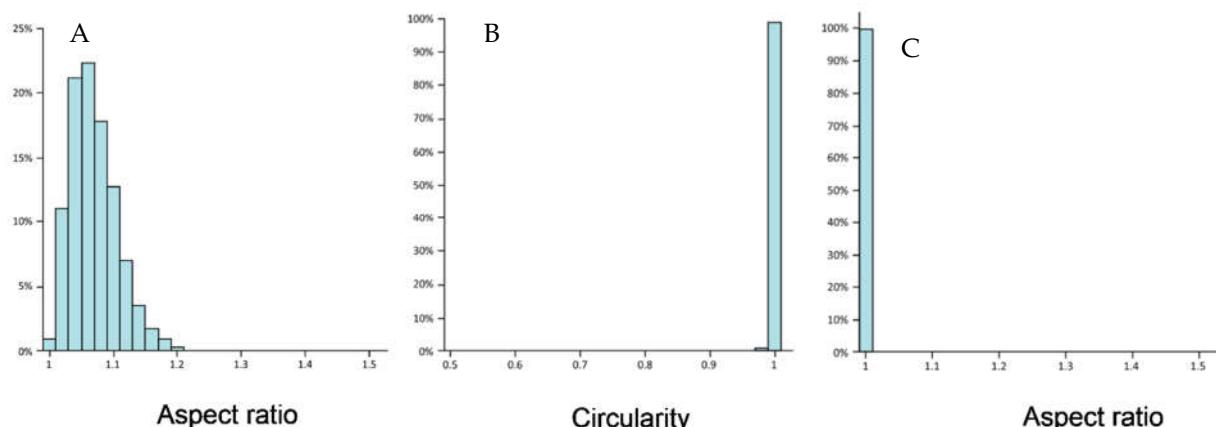

Rickard Nordström, Lin Zhu, Johan Härmark, Yael Levi-Kalisman, Erez Koren, Yechezkel Barenholz, Genia Levin-ton and Dima Shamrakov

**Figure S1.** Representative original (A) and processed (B) cryo-TEM Images of standard polystyrene particles, (C) size distribution histogram.

**Figure 2.** Circularity versus aspect ratio of an elliptical shape.

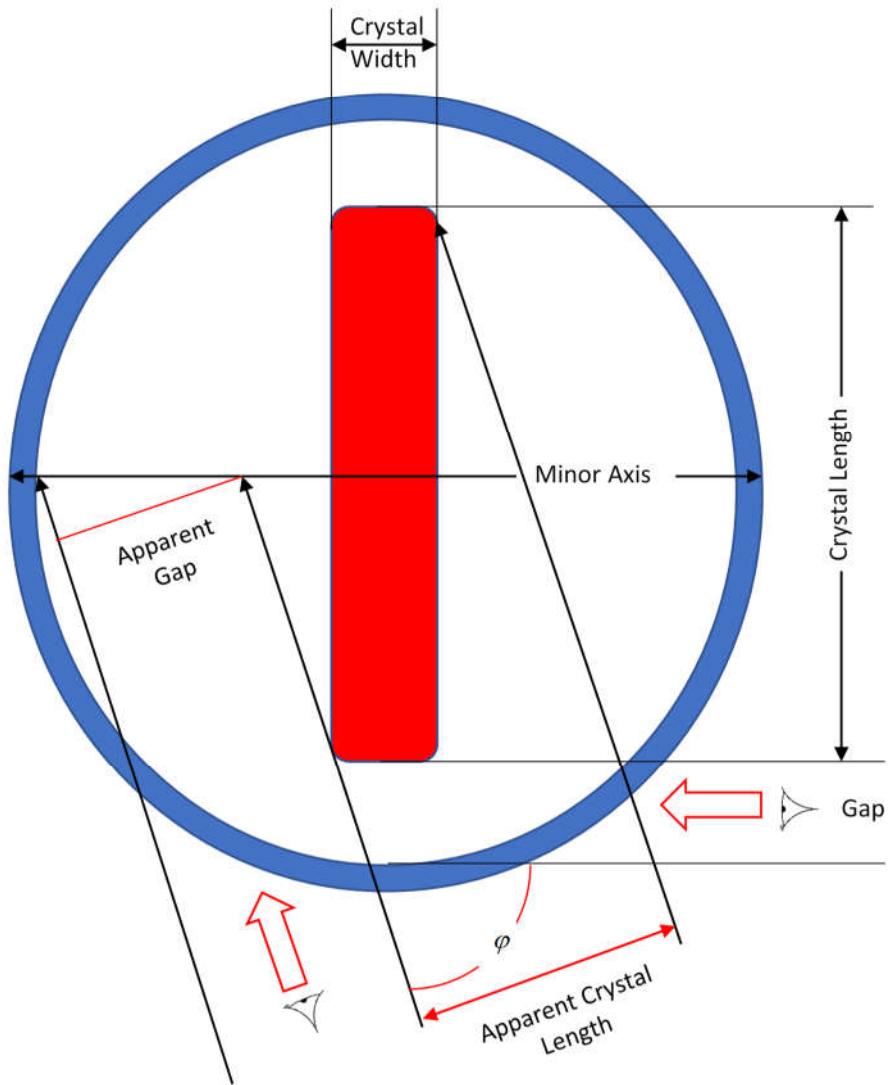

**Figure S3.** (A) and (B): aspect ratio and circularity of Doxil®-like liposomes, respectively; (C): aspect ratio of “empty” liposomes.

$$\text{Apparent Gap} = \frac{1}{2} \times (\text{Minor Axis} - \text{Membrane Thickness} - \text{Crystal Width} - \text{Crystal Length} \times \cot \varphi)$$

$$\text{Apparent Crystal Length} = \text{Crystal Length} \times \cos \varphi + \text{Crystal Width} \times \sin \varphi$$

where:  $\varphi$  – polar angle of the projection;

**Figure S4.** Apparent length and the distance between the crystal edge and the liposome membrane.
