Deciphering the Elevated Lipid via CD36 in Mantle Cell Lymphoma with Bortezomib Resistance Using Synchrotron-Based Fourier Transform Infrared Spectroscopy of Single Cells

Sudjit Luanpitpong, Montira Janan, Kanjana Thumanu, Jirarat Poohadsuan, Napachai Rodboon, Phatchanat Klaihmon and Surapol Issaragrisil

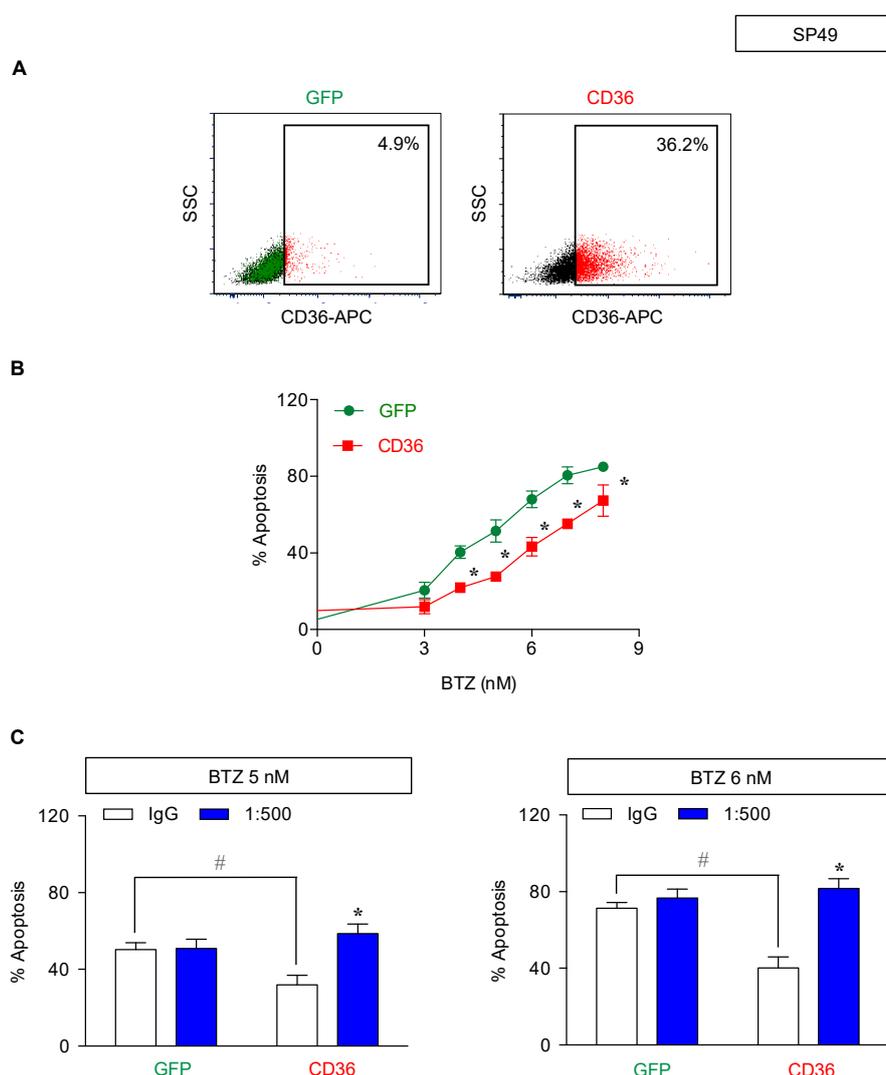

Figure S1. CD36 is a key mediator of BTZ-induced apoptosis. Human MCL-derived SP49 cells were transfected with CD36 or GFP control plasmid using nucleofection. (A) Flow cytometry analysis of surface CD36. Percentage of CD36-positive cells (box) were determined based on their internal negative control (unstained cells). (B) Apoptosis of CD36-overexpressing and GFP control cells in response to BTZ (0–8 nM) were determined by Hoechst 33342 assay at 24 h. Data are mean \pm SD ($n = 3$). * $p < 0.05$ versus GFP control; two-sided Student's t -test. (C) CD36-overexpressing SP49 cells were pretreated with neutralizing antibody (1:500) for 1 h and treated with BTZ (0–6 nM) for 24 h. After which, apoptosis was determined by Hoechst 33342 assay. Data are mean \pm SD ($n = 3$). * $p < 0.05$ versus BTZ-treated IgG control GFP or CD36-overexpressing cells; two-sided Student's t -test. # $p < 0.05$ versus GFP control; two-sided Student's t -test.

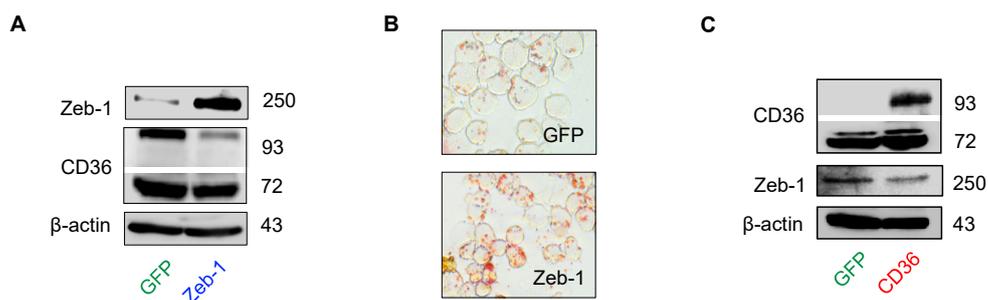

Figure S2. Overexpression of Zeb-1 and CD36 in MCL Jeko-1 cells. **(A)** Parental Jeko-1 cells were transfected with Zeb-1 or GFP control plasmid using nucleofection and levels of Zeb-1 and CD36 were evaluated by Western blotting. **(B)** Analysis of lipid droplets by oil red O staining in Zeb-1-overexpressing cells. **(C)** Jeko-1 cells were similarly transfected with CD36 or GFP control plasmid using nucleofection and levels of CD36 and Zeb-1 were evaluated by Western blotting.

Table S1. FTIR Band Assignment for Biological Samples.

Wavenumber (cm^{-1})	Assignment
3000–2800	C–H stretching mainly from lipid
1750–1735	C=O ester mainly from lipid
~1700–1600	Mainly $\gamma(\text{C}=\text{O})$ associated with protein as the amide I band
1685	Beta turn protein secondary structure
1652	α -helix protein secondary structure
1635	β -sheet protein secondary structure
~1600–1500	Amide II (protein N–H bend, C–N stretch), polysaccharide, glycoproteins
~1250,1080	P=O phosphodiester group from nucleic acid
~1160,1060,1037	C–O vibrations from glycogen and other carbohydrates, glycogen and other carbohydrate
~1121,954	C–C vibrations from RNA ribose chain nucleic acid
