**Figure S1.** Isolation and analysis of pancreatic cancer-derived EVs. **(a)** EVs were isolated by differential centrifugation and ultracentrifugation. **(b)** Mutant KRAS (G12D) was detected in L3.6pl-derived EVs, which was consistent with that in genomic DNA. **(c)** Proteomic analysis identified 3,139 proteins in L3.6pl-derived EVs and 2,691 proteins in TBO368-derived EVs. The Venn diagram showed an overlap of 2,406 proteins in both samples. **(d)** Heatmap showed enrichment of typical exosomal markers in L3.6pl-derived EVs and TBO368-derived EVs.

**Figure S2.** TGF-β1 inhibits NK cell function. **(a)** NK cells were treated with PBS or TGF-β1 for 24 hours. The percentage of NKG2D positive NK cells were analyzed by flow cytometry. **(b)** NK cells pre-treated with PBS or TGF-β1 were co-cultured with L3.6pl cells at a 1:1 ratio for 5 hours. The MFI of CD107a (left), IFN-γ (middle) and TNF-α (right) in NK cells was analyzed by flow cytometry. **(c)** NK cells were treated with PBS or TGF-β1 for 24 hours. NK cells were then analyzed by flow cytometry to determine the MFI of CD71 (left), and CD98 (middle), 2-NBDG incorporation (right).
