

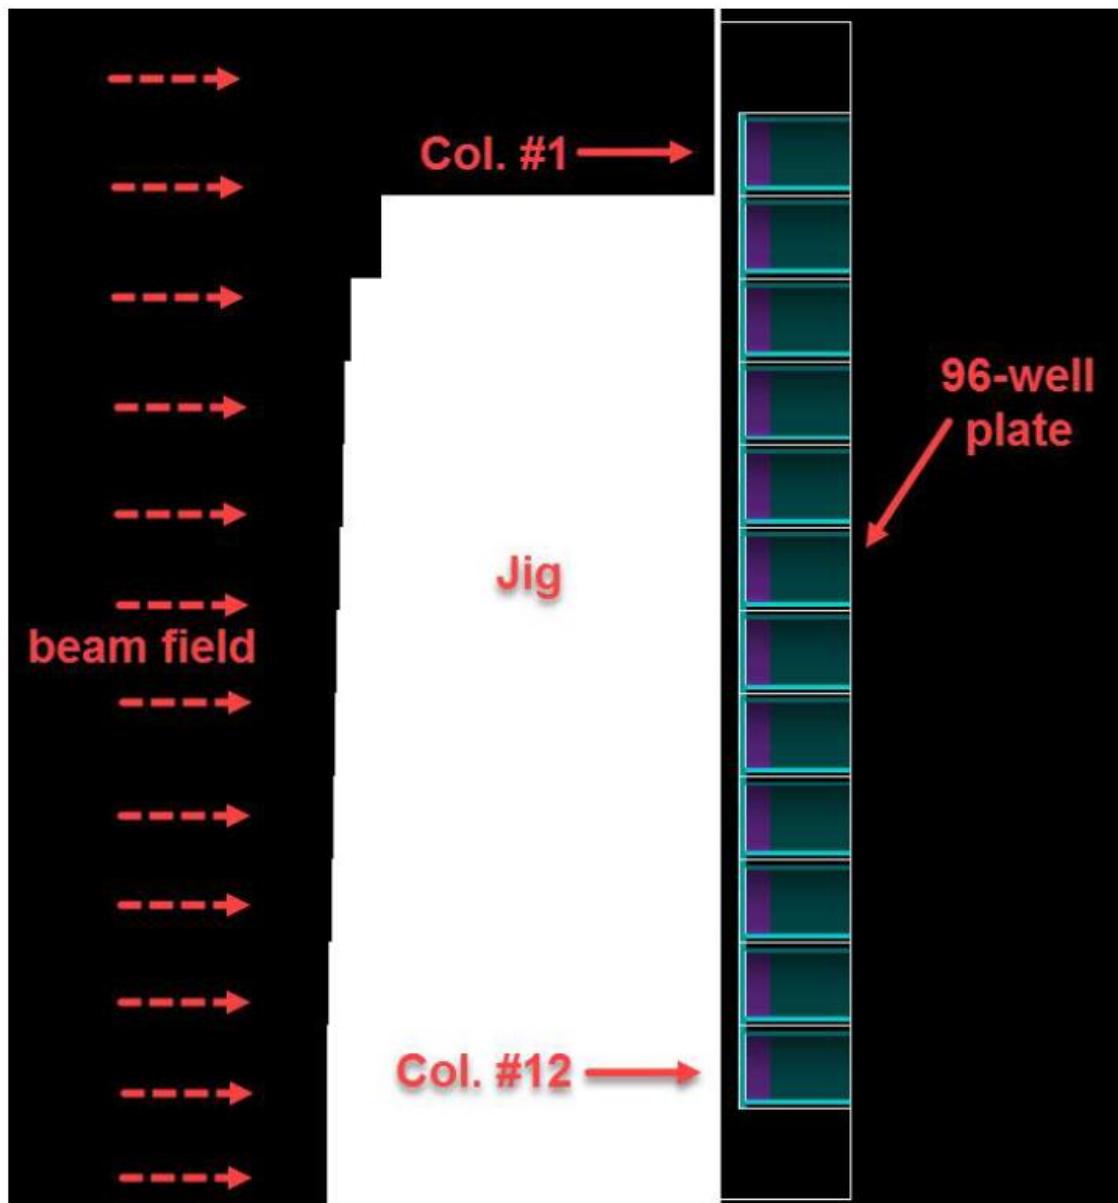

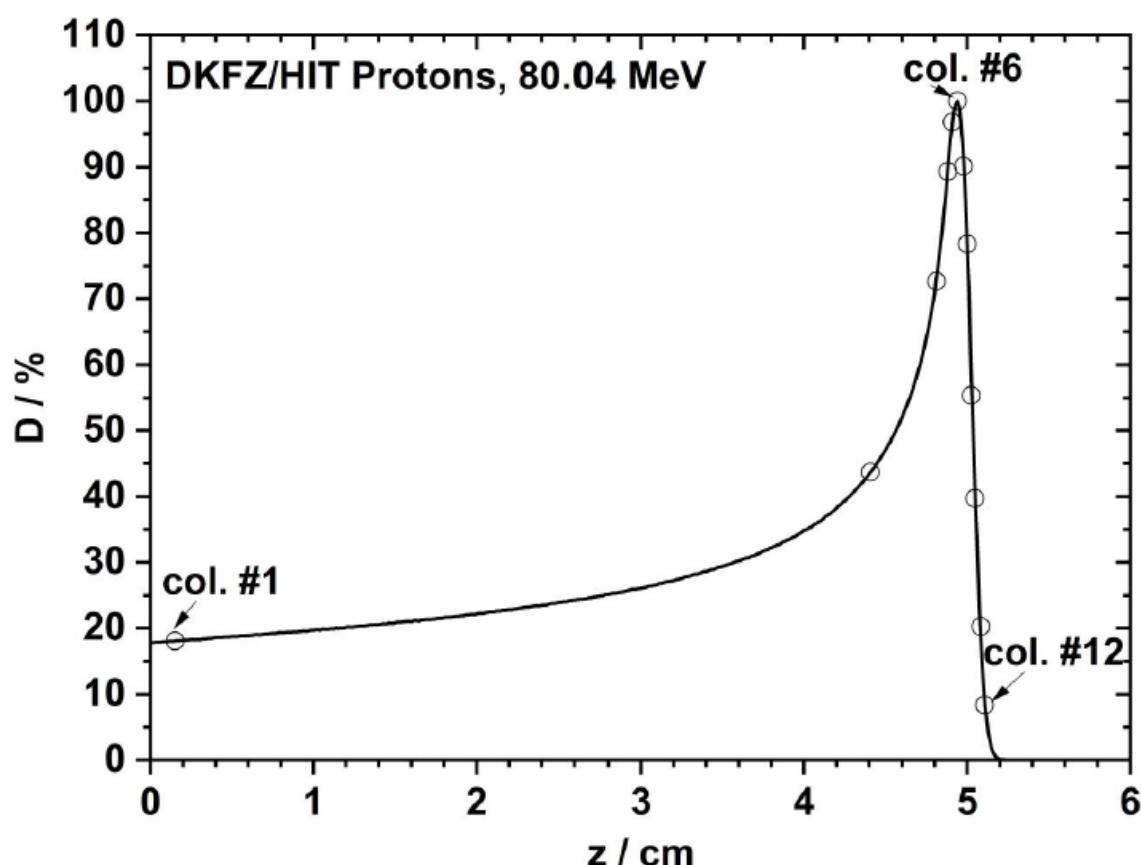

# Mapping the Relative Biological Effectiveness of Proton, Helium and Carbon Ions with High-Throughput Techniques

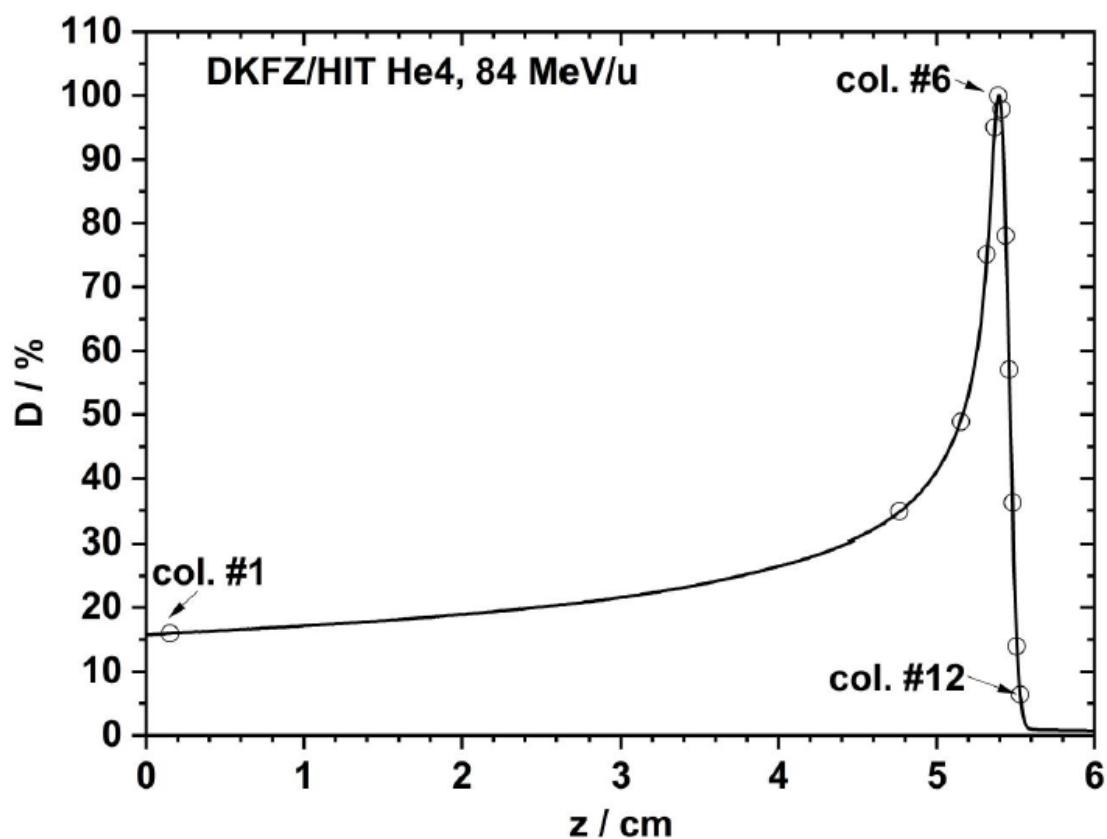

Lawrence Bronk, Fada Guan, Darshana Patel, Duo Ma, Benjamin Kroger, Xiaochun Wang, Kevin Tran, Joycelyn Yiu, Clifford Stephan, Jürgen Debus, Amir Abdollahi, Oliver Jäkel, Radhe Mohan, Uwe Titt and David R. Grosshans

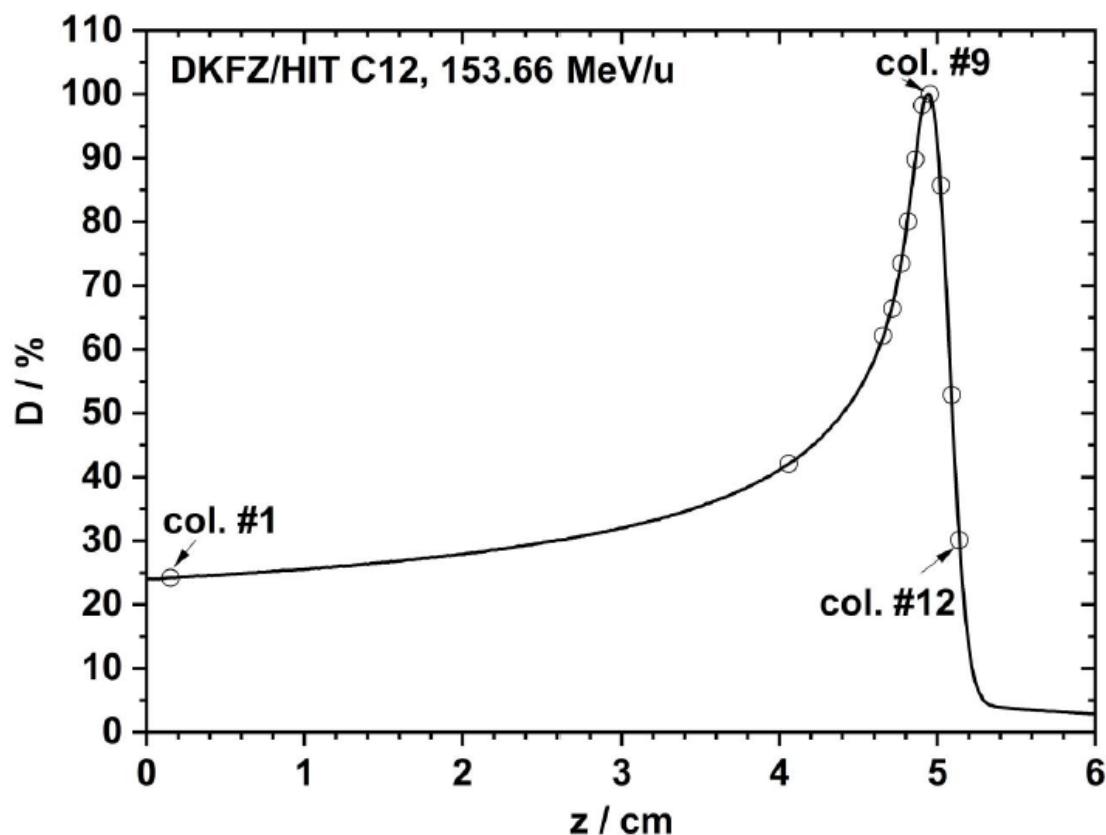

**Figure S1.** The experimental setup (modeled using Geant4) at HIT with a horizontal beam irradiating the jig (made of PMMA) and a 96-well cell culture plate with cells attached to the bottom of each well. Proton jig is illustrated here as an example. For each ion species, there is a specific jig designed according to its depth dose profile and the sampled locations. The thickness of each step was determined according to the spatial location selected from the depth dose curve.

**Figure S2.** The depth dose profile (in water) of the proton beam at HIT with the nominal energy of 80.04 MeV. The 12 locations used to sample the biological effect are marked with the circle.

**Figure S3.** The depth dose profile (in water) of the Helium-4 ion beam at HIT with the nominal energy of 84 MeV/u. The 12 locations used to sample the biological effect are marked with the circle.

**Figure S4.** The depth dose profile (in water) of the Carbon-12 ion beam at HIT with the nominal energy of 153.66 MeV/u. The 12 locations used to sample the biological effect are marked with the circle.

**Table S1.** H1437 linear-quadratic fitting parameters from proton irradiations done at the Heidelberger Ionenstrahl Therapiezentrum.

Abbreviation: y<sub>d</sub>, dose-mean lineal energy; y\*, saturation-corrected dose-mean lineal energy (calculated with the saturation parameter of y<sub>0</sub> = 150 keV/ $\mu$ m); SE, standard error from the data fitting.

**Table S6.** Physical parameters of the helium and carbon ion irradiation setups. Each column of a standard 96-well microplate was placed such that the incident beam traveled through a different PMMA thickness before impinging on the bottom of the plate. Monte Carlo simulations using the Geant4 toolkit were used to determine the LETd (primary particles only) and y<sub>d</sub> and dose within each column.

| Column                        | 1    | 2     | 3     | 4     | 5     | 6     | 7     | 8     | 9     | 10    | 11    | 12    |
|-------------------------------|------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| Helium                        |      |       |       |       |       |       |       |       |       |       |       |       |
