

Supplementary Materials: 1,3-Diene Polymerization Mediated by Homoleptic Tetramethylaluminates of the Rare-Earth Metals

Christoph O. Hollfelder ¹, Lars N. Jende ¹, Dominic Diether ¹, Theresa Zelger ¹, Rita Stauder ¹, Cäcilia Maichle-Mössmer ¹ and Reiner Anwander ^{1,*}

S1. Polymerization Data

S1.1 Isoprene polymerization at standard conditions

If not mentioned otherwise in the respective table, the polymers shown in this section have been synthesized according to the procedure given in Section 3.4 of the main article (Materials and Methods) or are taken from the literature for comparison.

Table S1.1.1. Comparison of the polyisoprenes obtained applying cocatalyst A^a

entry ^b	precatalyst	cocatalyst ^c	yield [%]	cis-content [%] ^d	trans-content [%] ^d	vinylic content [%] ^d	M _n [10 ⁴ g/mol] ^e	PDI ^f	T _g [°C] ^g	ref.

S1.4 Isoprene polymerization screenings

In order to gain more insight into the polymerization-active species, the standard conditions given in Section 3.4 of the main article (Materials and Methods) have been augmented as presented in the respective tables. Besides the obtained data, our group has reported on isoprene polymerization in *n*-hexane applying combinations of $\text{Ln}(\text{AlMe}_4)_3/\text{E}$ ($\text{Ln} = \text{La}$ [4,5], Pr [6], Gd [4,5]) resulting in high yields after 24 h and nearly quantitative *cis*-selectivity. Moderate yields and selectivity were obtained for $\text{Ln} = \text{Y}$ [4,5] and low yields (<7%) but high *cis*-contents after 24 h reaction time for $\text{Sm}(\text{AlMe}_4)_3$ [4,5]. Polymerization attempts with $\text{Nd}(\text{AlMe}_4)_3$ applying Me_3SiCl as a chlorine source did not reveal any polyisoprene formation, nor is $\text{Nd}(\text{AlMe}_4)_3$ active as a single component catalyst. Furthermore, polymerizations with some of the low yielding systems at standard conditions have been repeated with a reaction time of 24 h (results can be found in Table S1.4.4).

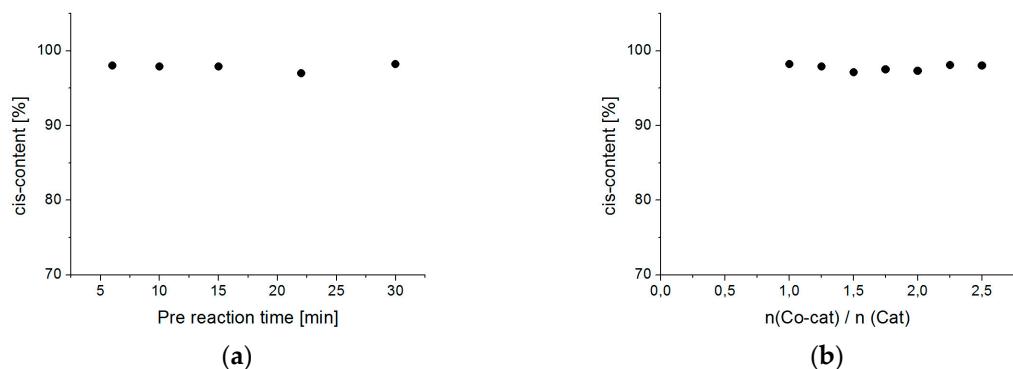

Figure S1.4.1. Overview on the *cis*-contents obtained by screening the pre-reaction time (a) and cocatalyst concentration (b) of the isoprene polymerization applying $\text{Nd}(\text{AlMe}_4)_3$ (2^{Nd})/ Et_2AlCl (E).

Table S1.4.1. Influence of pre-reaction time on isoprene polymerization by $2^{\text{Nd}}/\text{E}^{\text{a}}$

entry ^b	pre-reaction time [min]	yield [%]	<i>cis</i> -content [%] ^d	<i>trans</i> -content [%] ^d	vinylic content [%] ^d	M_n [10 ⁴ g/mol] ^e	PDI ^e	ref.

S1.5 Polyisoprene data on UV-light irradiated samples

Polymer data reported in this section were obtained from samples produced according to the standard conditions given in Sections 3.4 and 3.5 of the main article (Materials and Methods) and thereafter irradiated applying UV-light of 254 nm for 48 h under air. Data obtained before radiation are presented for comparison.

Table S1.5.1. Polymer data of polyisoprenes applying $\mathbf{2}^{\text{Nd}}$ after exposure to UV-light of 254 nm ^a

entry ^b	cocatalyst ^c	cis-content [%] ^d	trans- content [%] ^d	vinylic content [%] ^d	M_n [10^4 g/mol] ^e	PDI ^e	ref.

5.2.5 Polyisoprene irradiated by UV-light at 254 nm

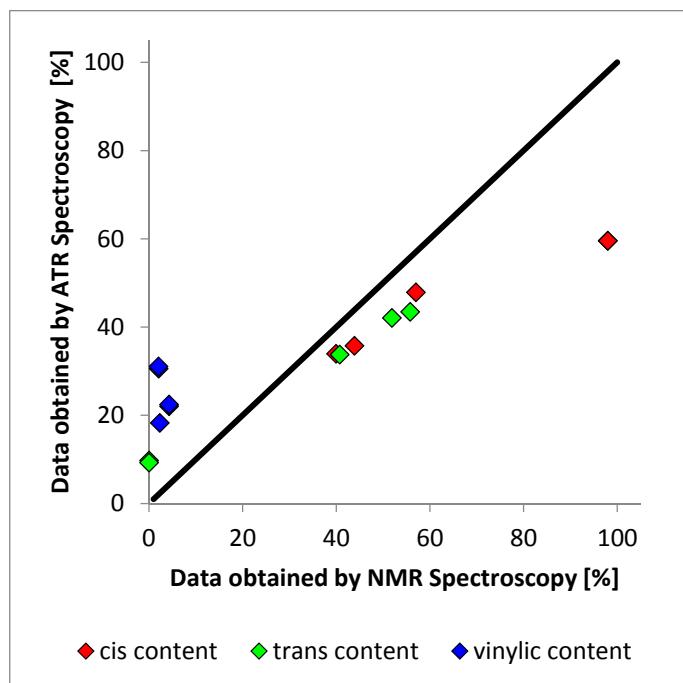

Figure S2.5.1. Comparison of the microstructure results obtained by NMR and ATR-IR spectroscopy, applying Nd(AlMe₄)₃ (2^{Nd}) and cocatalysts A-E (A = [Ph₃C][B(C₆F₅)₄], B = [PhNMe₂H][B(C₆F₅)₄], C = B(C₆F₅)₃, D = Me₂AlCl, E = Et₂AlCl) in one equivalent and 48 h of UV radiation at 254 nm. For detailed polymerization data see Tables S1.2.4, S1.5.1 and S2.5.1.

Table S2.5.1 Comparison of the microstructure results by NMR and ATR-IR spectroscopy, data from UV-irradiated samples of isoprene polymerization applying **2Nda**

entry ^b	cocatalyst ^c	cis-content [%] ^d	NMR			ATR-IR			ref.
			trans- content [%] ^d	vinylic content [%] ^d	cis-content [%] ^e	trans- content [%] ^e	vinylic content [%] ^e		
1	A	43.9	51.9	4.3	35.8	42.1	22.1	-s	
2	B	39.9	55.8	4.3	34.0	43.5	22.5	-s	
3	C	57.0	40.7	2.3	47.9	33.8	18.3	-s	
4	D	97.9	0.0	2.1	59.6	9.8	30.6	-s	
5	E	98.0	0.0	2.0	59.6	9.3	31.1	-s	

^a For detailed data on the respective chain properties, see Tables S1.2.4 and S1.5.1. ^b Conditions: samples obtained from isoprene polymerization were exposed to UV-light of 254 nm for 48 h. ^c A = [Ph₃C][B(C₆F₅)₄], B = [PhNMe₂H][B(C₆F₅)₄], C = B(C₆F₅)₃, D = Me₂AlCl, E = Et₂AlCl. ^d Determined by ¹H and ¹³C NMR spectroscopy in CDCl₃. ^e Determined by ATR-IR spectroscopy. ^s This study.

Values reported for the 3,4 contents in Table and Figure S2.5.1 are given, as obtained from the algorithm. As a shift towards vinylic linkage by UV radiation does not seem likely, it is assumed, that UV-induced crosslinking creates oscillations in the IR spectrum that are misinterpreted by the algorithm.

S3. Extrapolation of the Ratio n(Chains) / n(Ln Centers)

In order to obtain the ratio of polymer chains per lanthanide center, the assumption is made, that if the polymerization would not be stopped after 1 h of reaction time, it would continue in the same fashion until all monomer is consumed.

The extrapolated number average molecular mass is then given by

$$M_{n,ext}(c_M = 0) = \frac{M_n(1\text{ h})}{Yield(1\text{ h})}, \quad (1)$$

where c_M is the concentration of the monomer. Due to the assumption discussed above, errors occur, as the system, investigated in this study, is intended to set free a chain transfer agent AlMe₃, that could cause the initiation of new chains at all times. As the chain transfer capability of AlMe₃ is known to be low, and chain termination plays only a minor role in catalyzed polymerization, these errors are assumed to be low enough to be neglected.

The respective degree of polymerization is given by equation (2).

$$P_{n,ext} = \frac{M_{n,ext}}{M_M}, \quad (2)$$

where M_M is the molecular mass of the monomer.

For 100% monomer consumption, equation (3) applies.

$$P_n = \frac{n_M}{n_{act\text{ }Ln}} = \frac{n_M}{n(\text{chains})}, \quad (3)$$

where n_M is the amount of monomer fed [mol] and therefore constant during the whole reaction. n_{act}_{Ln} is the amount of active lanthanide centers [mol], and n(chains) the amount of polymer chains formed during the reaction [mol].

P_{n,exp}, the expected degree of polymerization if all Ln centers grow polymer chains is given by

$$P_{n,exp} = \frac{n_M}{n_{Ln}} = \frac{n_M}{n(\text{chains})_{exp}}, \quad (4)$$

where n_{Ln} is the total amount of Ln centers. Therefore,

$$\frac{P_{n,exp}}{P_{n,ext}} = \frac{n(chains)}{n_{Ln}} = \frac{n_{act\ Ln}}{n_{Ln}} \quad (5)$$

Applying this extrapolation to the isoprene polymerizations discussed in Sections S1.1 - S1.3 led to the matrix shown as Table S3.1.

Table S3.1 Comparison of the ratios of the amounts of polymer chains and lanthanide centers obtained for the polyisoprenes^a

entry ^b	cocatalyst ^c	precatalyst [Ln(AlMe ₄) ₃] (2 ^{Ln})											
		2 ^{Ia}	2 ^{Ce}	2 ^{Pr}	2 Nd	2 ^{Gd}	2 ^{Tb}	2 ^{Dy}	2 ^{Ho}	2 ^Y	2 ^{Er}	2 ^{Lu}

10	2E	0.15	0.75	1.39	1.11	1.89	2.82	1.96	0.11	0.47	-f	-f	

^a For detailed information on polymerization data and origin of the values (literature or this study), see sections S1.1 and S1.2. For information on the color code, *vide infra*. ^b Conditions: 0.02 mmol of the resp. Ln precatalyst, 0.02 or 0.04 mmol cocatalyst, in toluene, [Ln]:[isoprene] 1:1000 (n/n), reaction time 1 h, pre-reaction time 0.5 h. ^c A = [Ph₃C][B(C₆F₅)₄], B = [PhNMe₂H][B(C₆F₅)₄], C = B(C₆F₅)₃, D = Me₂AlCl, E = Et₂AlCl. ^f No further evaluation possible due to low yield. ^h Reaction time 24 h.

Table S3.1 shows the values implying multinary active species or low initiation rates (as n(chains) / n(Ln centers) < 1) in green color. Those, which grow more than one chain per metal center or imply chain transfer or termination are given in blue and red; red highlights those active systems, that grow more than two chains per Ln center.

S4. Crystal Structure Data

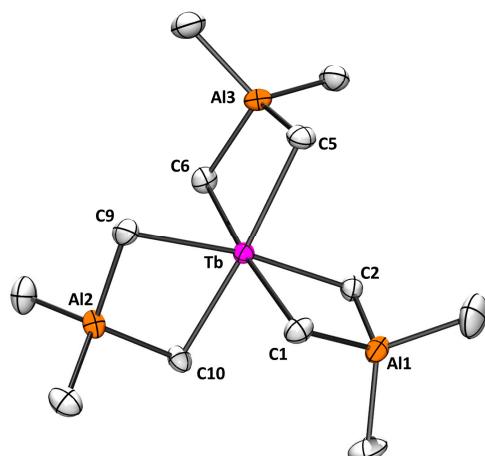

Figure S4.1. ORTEP view of one of two individuals in the unit cell of 2^{Tb}. Atoms are represented by atomic displacement ellipsoids at the 50% level. Hydrogen atoms are omitted for clarity. Selected distances (Å) and angles (deg): Tb1–C1 2.537(4), Tb1–C2 2.520(4), Tb1–C5 2.536(4), Tb1–C6 2.519(4), Tb1–C9 2.522(4), Tb1–C10 2.544(4), average Tb1–CX (X = 1, 2, 5, 6, 9, 10) 2.536, Al1–C1, 2.089(4), Al1–C2, 2.083(4); C1–Tb1–C2 84.27(12), C1–Tb1–C5 92.14(13), C1–Tb1–C6 175.02(13), C1–Al1–C2 108.81(15).
