

Supplementary material

Table S1. List of locations tested in Europe from 2001 to 2013. Site numbers refer to the location code used during the analysis.

| Site number | Sites | Country | Site number | Sites | Country |
|-------------|----------------------|-----------------------|-------------|----------------------|-------------|
| 1 | Aberystwyth | UK (Wales) | 18 | Malchow | Germany |
| 2 | Les Alleuds | France | 19 | Merelbeke | Belgium |
| 3 | Hof Steinke Asendorf | Germany | 20 | Montours | France |
| 4 | Aston le Walls | UK | 21 | Neuhof | Germany |
| 5 | Boelshoj | Denmark | 22 | Nort s. E. | France |
| 6 | Bornhof | Germany | 23 | Orchies | France |
| 7 | Druelle | France | 24 | Ottersum | Netherlands |
| 8 | Flaujaques | France | 25 | Perugia | Italy |
| 9 | Gumpenstein | Austria | 26 | Pulling | Germany |
| 10 | Hladke Zivotice | Czechia | 27 | Radzików | Poland |
| 11 | Hohenheim | Germany | 28 | Zurich (Reckenholz) | Switzerland |
| 12 | Jevicko | Czechia | 29 | Rennes | France |
| 13 | Lelystad Barenbrug | Netherlands | 30 | Rilland/Swift erband | Netherlands |
| 14 | Lelystad Cebeco | Netherlands | 31 | Les Rosiers | France |
| 15 | Lodi | Italy | 32 | Roznov Zubri | Czechia |
| 16 | Loughgall | UK (Northern Ireland) | 33 | Spitalhof | Germany |
| 17 | Gross Luesewitz | Germany | 34 | Steinach | Germany |

Table S2. The adopted scoring scale reported by Schubiger et al. [4]. The rating values represent a relative estimate of the leaf area affected by rust.

| SCORE | PHENOTYPE |
|-------|--------------------------------------|
| 1 | no rust |
| 2 | trace of rust |
| 3 | 5 % of the foliage covered with rust |
| 4 | 10% of the foliage covered with rust |

- 5 25 % of the foliage covered with rust; predominantly leaves with scattered pustules
 6 40 % of the foliage covered with rust; leaves spotted with many pustules
 7 60 % of the foliage covered with rust; leaves densely covered with areas of rust and few necroses
 8 75 % of the foliage covered with rust; leaves densely covered with rust and many necrotic leaves
 9 more than 75 % of the foliage covered with rust; predominantly leaves with necrosis

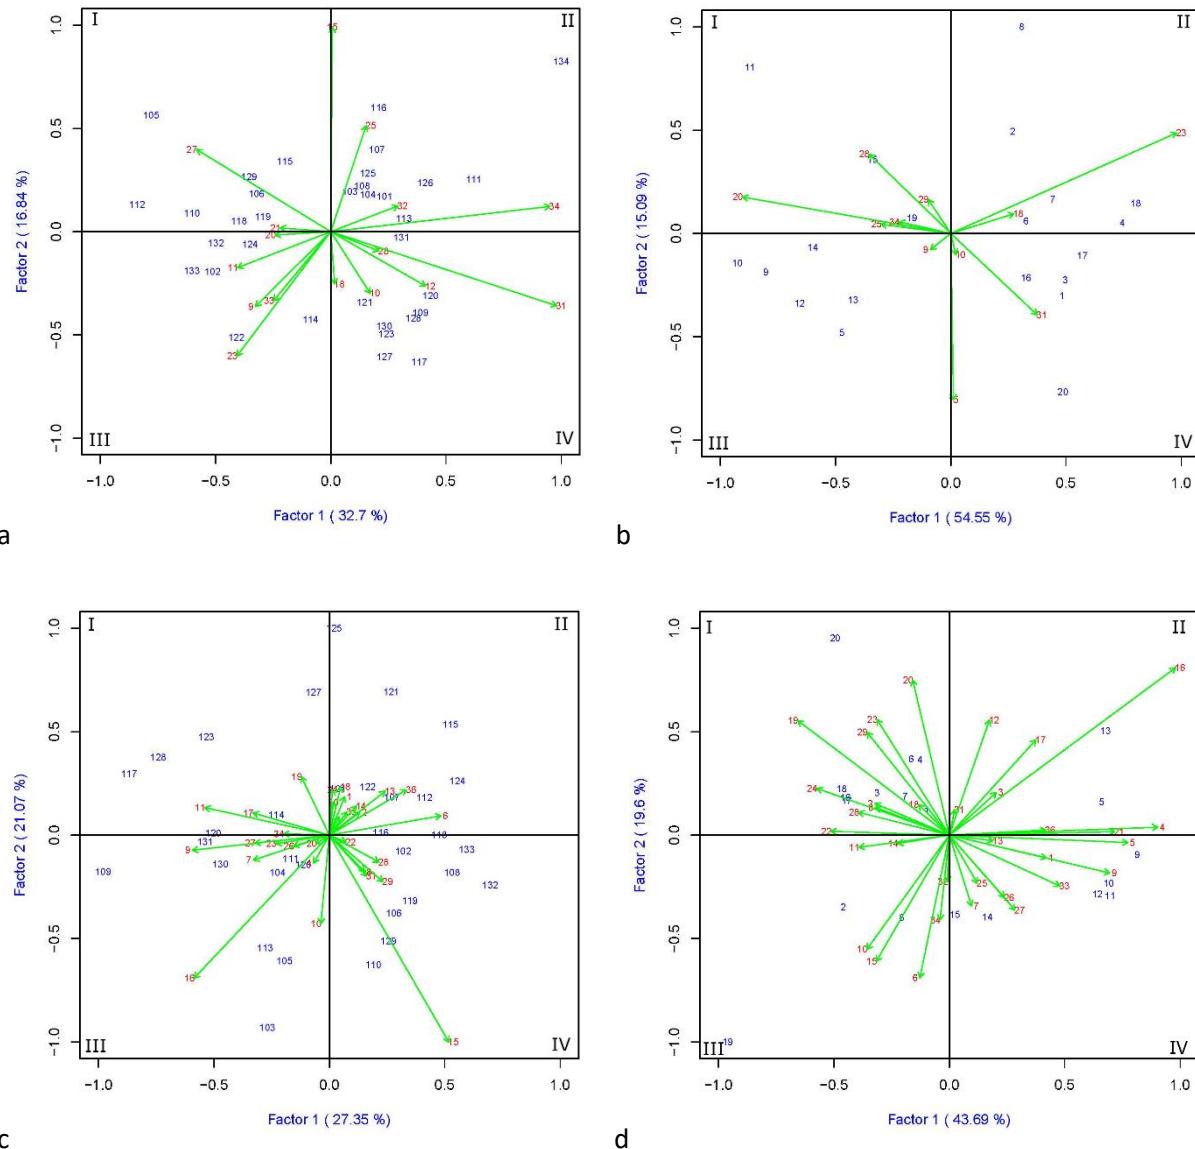

Figure S1. AMMI 2 biplot for PGR in a) LP and b) in LM and for PCO c) LP and d) LM. Green arrows refer to environmental vectors, the red numbers represent the locations and the blue numbers represent the varieties. The arrows' length indicates variability in the variation response for that particular environment: the longer the arrow, the higher is the response variability. Only the endpoints of the genotype vectors are represented in the plots. The angle between their vectors assesses the interaction between varieties and environments. Acute angles indicate positive interaction; obtuse angle indicates a negative correlation, and right angle represents no interaction.

Table S3. Summary of perennial ryegrass varieties information. Mean of the rust resistance scores across all tested environments; coefficient of variation % (CVar); slope of regression (b_i), deviation from regression (S^2_{di}) of the perennial ryegrass varieties

| VARIETIES | | | PCO-LP | | | | | PGR-LP | | | | |

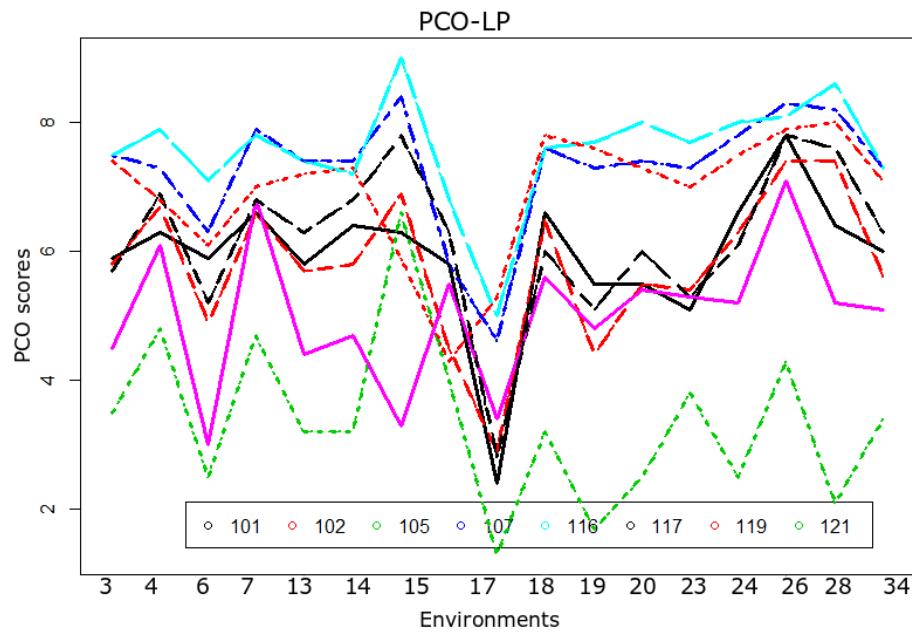

Figure S2. Response variability across environments. Scoring levels (y-axis) of eight perennial ryegrass varieties to crown rust in different environments (x-axis). Colors of the lines refer to the varieties.
