

Table S1. Selected muscle diseases.

Disease	Disease description
Myotonic dystrophy (DM)	The most common adult muscular dystrophy, is characterized by autosomal dominant progressive myopathy. Two distinct forms caused by similar mutations in two different genes have been identified: myotonic dystrophy type 1 (DM1, with mutations in myotonin-protein kinase) and myotonic dystrophy type 2 (DM2 with mutations in the cellular nucleic acid-binding protein gene, <i>CNBP</i>).
Duchenne muscular dystrophy (DMD)	An X-linked recessive disorder in the dystrophin gene (1/5000 boys) presents in early childhood (age of 4) with proximal muscle weakness. Dystrophin function is linked with microtubule binding. The absence of dystrophin causes DMD.
Becker muscular dystrophy (BMD)	Mutations resulting in a reduced amount or shortened dystrophin protein cause BMD. BMD has a mean onset at 12 years, with loss of ambulation occurring around the third decade of life, and a life expectancy that is similar to the general population, contrasting DMD.
Pompe disease	A rare and deadly muscle disorder, combines a glycogen storage disorder, a lysosomal disorder, and an autophagic myopathy, caused by mutations in the gene coding for acid alpha-glucosidase (GAA, breaking down glycogen in the lysosome acidic milieu).
Tibial muscular dystrophy (TMD)	A late onset, autosomal dominant distal myopathy, results from mutations in the two last domains of titin (associated with the unfolded protein response and altered autophagy).
Dysferlinopathies	Harboring dysferlin mutations (<i>DYSF</i>). Dysferlin is responsible for membrane resealing, and mutations may result in a defect in membrane repair following mechanical or chemical stress, causing an influx of Ca^{2+} and affecting mitochondrial function.
Secondary dystroglycanopathies	Mutations in the fukutin related protein gene (<i>FKRP</i>) cause secondary dystroglycanopathies, muscular dystrophies that result from mutations in genes that participate in dystroglycan glycosylation, which is in turn essential for the muscle fibers to adhere to the muscle extracellular matrix.
Amyotrophic lateral sclerosis (ALS)	ALS patients also suffer from muscle wasting and our previous studies have shown brain tauopathy in the SOD1-G93A mouse model of ALS, which was corrected by NAP. (See main text, discussion).

Table S2. A tabular summary of the different patients and aged matched controls characterizations.

Disease	Pompe	DMD	DM2	TMD	BMD	DYSF	FKRP	ALS
Age of sampling	Control: 2m-2y 11 m Patient: 1 y 5 m	Control: 5-7 y Patient: 1-10 y	Control: 45-54 y Patient: 37-55 y	Control: 76-80 y Patient: 48-65 y	Control: N/A Patient: 10-32 y	Control: N/A Patient: 16-38 y	Control: N/A Patient: 12-55 y	Control: N/A Patient: 45-55 y
Muscle type	Biceps	Quadriceps	Vastus lateralis	Distal muscles	Typically, from the vastus lateralis			
Sex	Males & Females	Males	Males & Females	Males	Males	Males & Females	Males & Females	Males

Table S3. G68 off targets. The vast majority have 4 mismatches with the G68 sequence, some have 3 and only 1-off target has 2 mismatches (intrinsic), making the effects of these targets mostly negligible.

Table S4. Summary of significant fold-changes in reference to the tested parameters in CatWalk gait analysis affected by *Adnp* knockdown, NAP treatment and sex.

Tested parameters		Genotype Effect G68 vs. Poly T		NAP Treatment Effect G68 NAP vs. G68		Sex Effect Females vs. Males		
		Males	Females	Males	Females	Poly T	G68	G68 NAP
Run Characterization	Run duration				0.77			
	Cadence	1.20	0.81			1.27		
Interlimb Coordination	Swing speed-RF		0.77		1.174			
	Swing speed-LF		0.74		1.23			
	Swing speed-LH		0.78		1.40		0.75	
	Body speed-RF		0.75		1.20			
	Body speed-LF		0.74		1.21			
	Body speed-RH		0.75					
	Body speed-LH		0.72		1.24			
	Step cycle-RF		1.30			0.826		
	Step cycle-LF					0.80		
	Step cycle-RH		1.35			0.792		
	Step cycle-LH	0.81	1.32		0.82	1.12	0.88	

	BOS- front paws					0.87	
	BOS- hind paws		0.84		1.10		
	Step Sequence				0.913		
	Support Three	0.85					
	Support Diagonal	1.29					
	Support Lateral						9.12
Temporal Parameters	Single Stance-RF		1.33			0.84	
	Single Stance-RH		1.27		0.82		1.20
	Initial Dual Stance-RF	0.58	1.50			0.55	
	Initial Dual Stance-RH		1.87			0.47	
	Terminal Dual Stance-RH					0.52	
	Terminal Dual Stance-LH	0.60				0.61	
	Max Intensity AT		0.90			1.10	
Spatial Parameters	Mean Intensity Of The 15 Most Intense Pixel-RF		0.93			0.94	0.91
	Mean Intensity Of The 15 Most Intense Pixel-LF		0.93		1.10		0.91
	Mean Intensity Of The 15 Most Intense Pixel-RH						0.82
	Mean Intensity Of The 15 Most Intense Pixel-LH					0.86	
	Print Width-RH					0.86	
	Print Width-LH		0.92				0.91

Supplemental Figures:

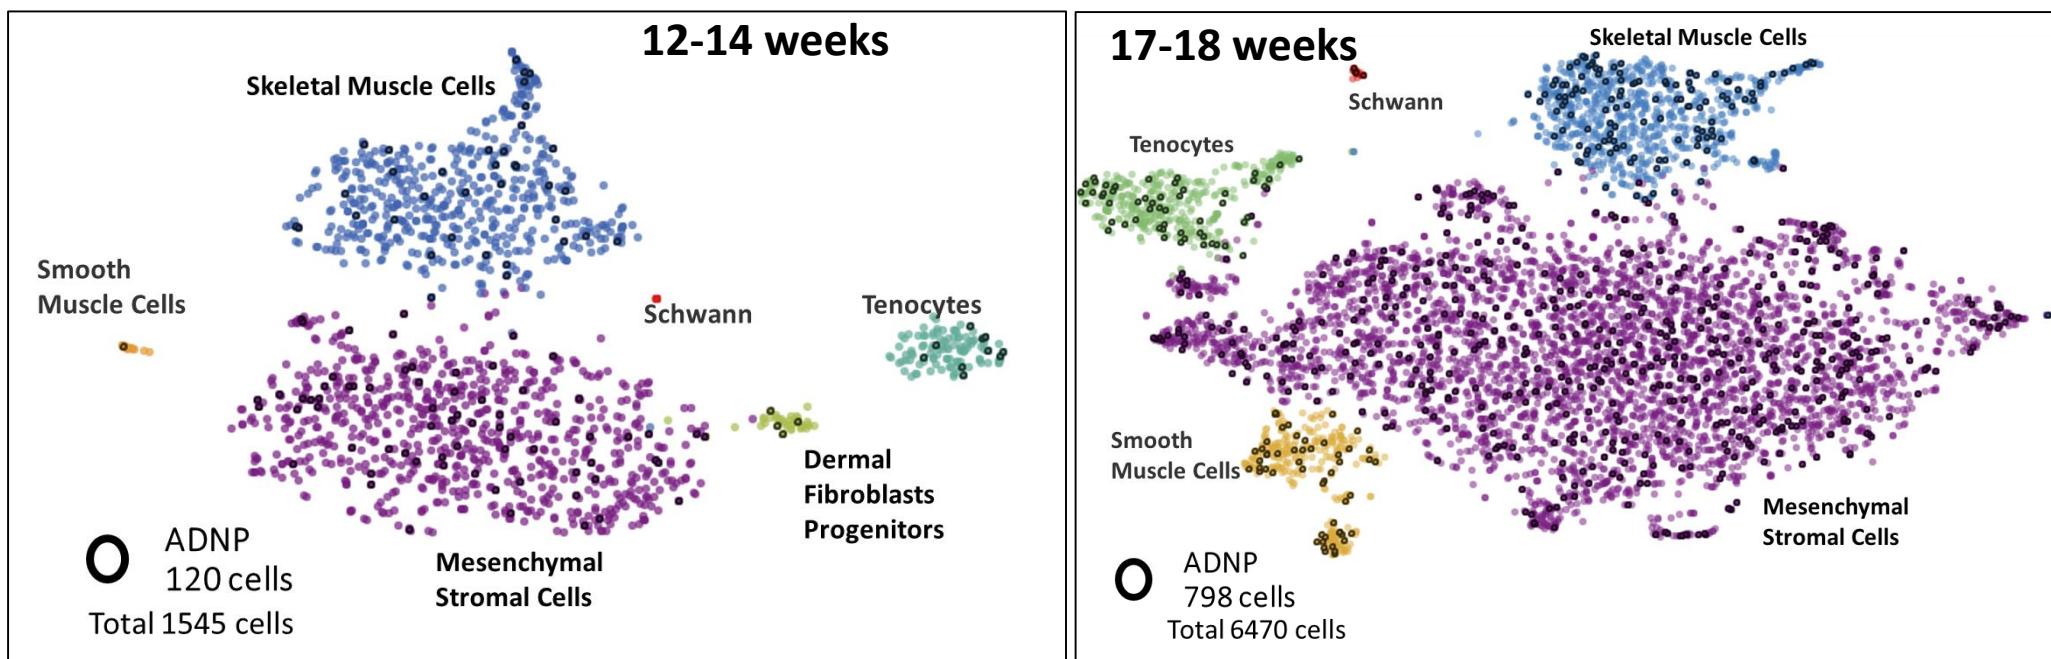

Figure S1. Single human muscle cell ADNP cellular distribution at different time points during gestation.

As in Figure 1, assessing human embryo limbs at 12-14 and 17-18 weeks of gestations.

Expression levels

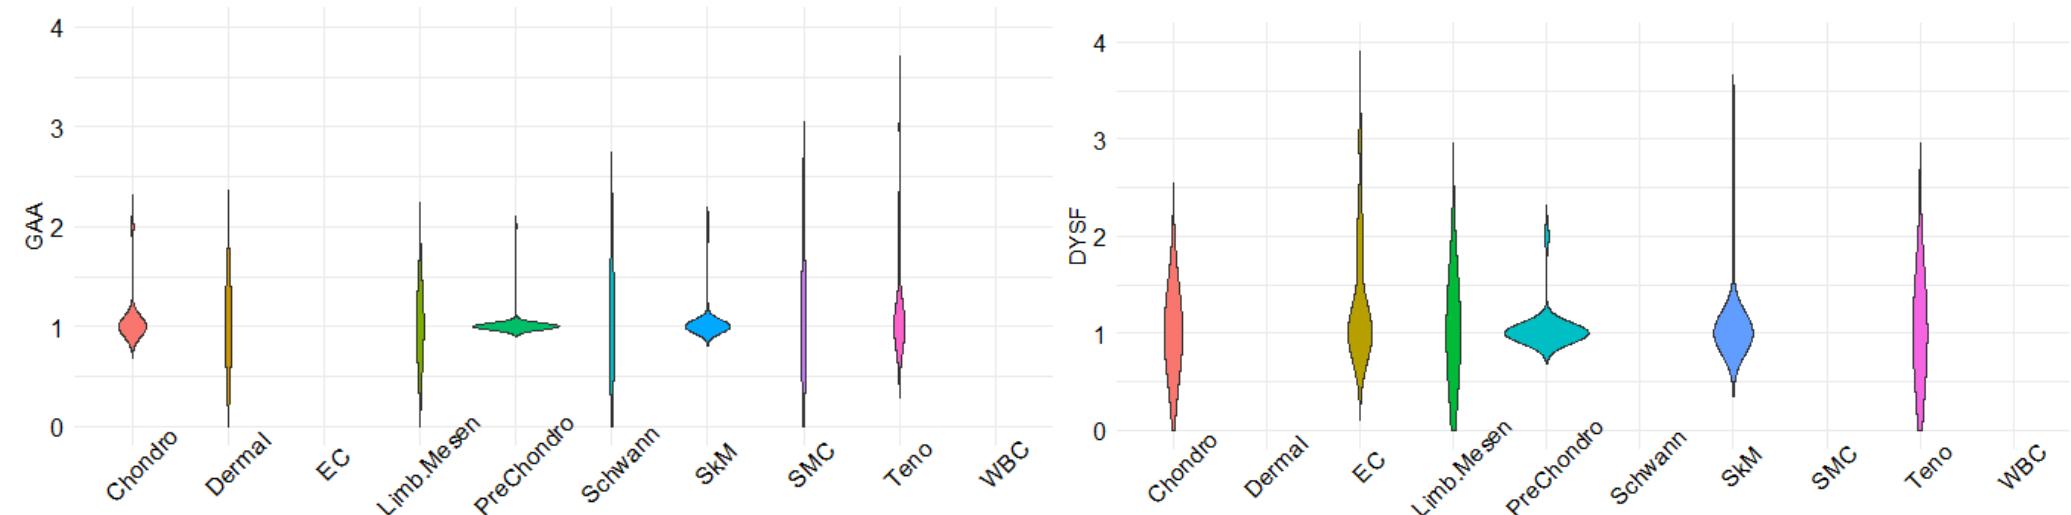

Figure S2 Single cell specific gene transcriptomes of hind limbs from human fetuses of 9 weeks

Violin graphs as in Figure 1, representative transcripts as per diseases depicted in Figure 2.

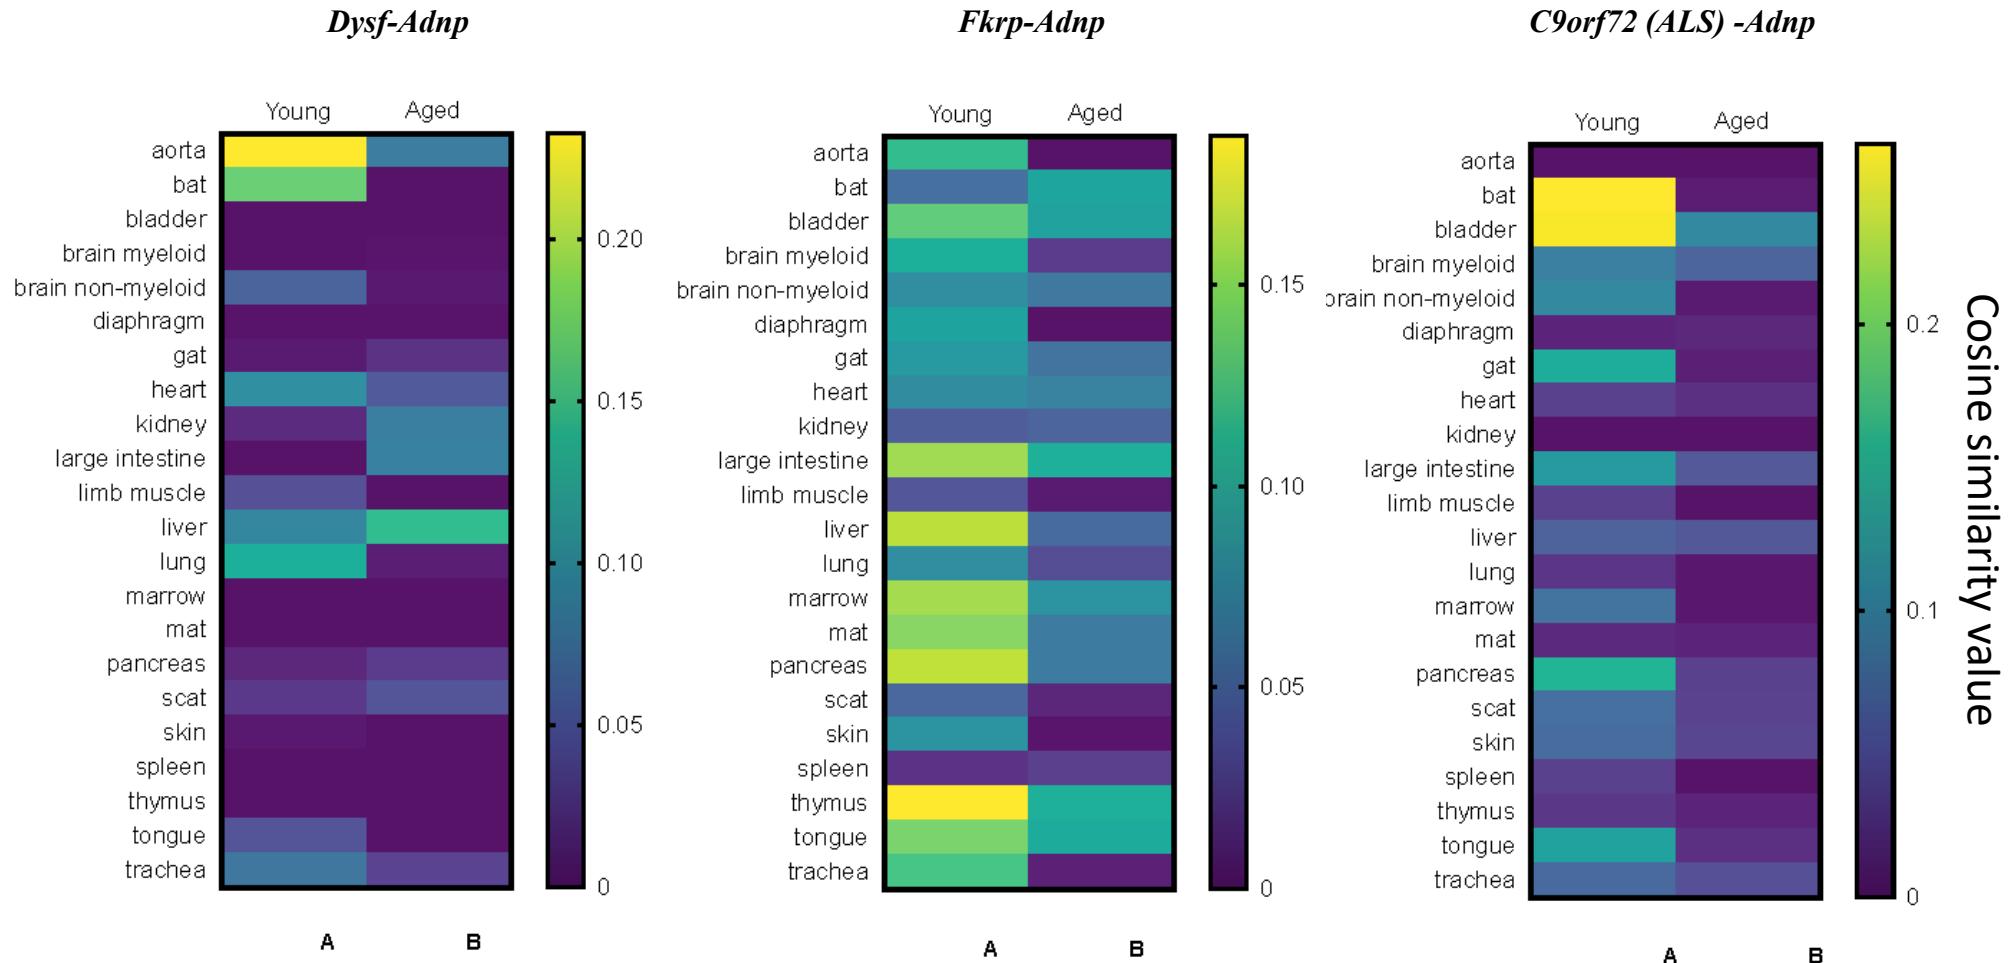

Figure S3. Overall systemic loss of correlation of expression of *Adnp* and disease genes at the single cell level.

Heatmaps plotting cosine similarity values (indicating co-expression at the single cell level) for the genes of interest (indicated above each heatmap) and *Adnp* in young (3 months) and aged mice(18 and 24 months) in 22 tissues (indicated in rows). GAT, SCAT, MAT and BAT stand for gonadal-, subcutaneous-, mesenteric- and brown- adipose tissue.

14-month-old male mice

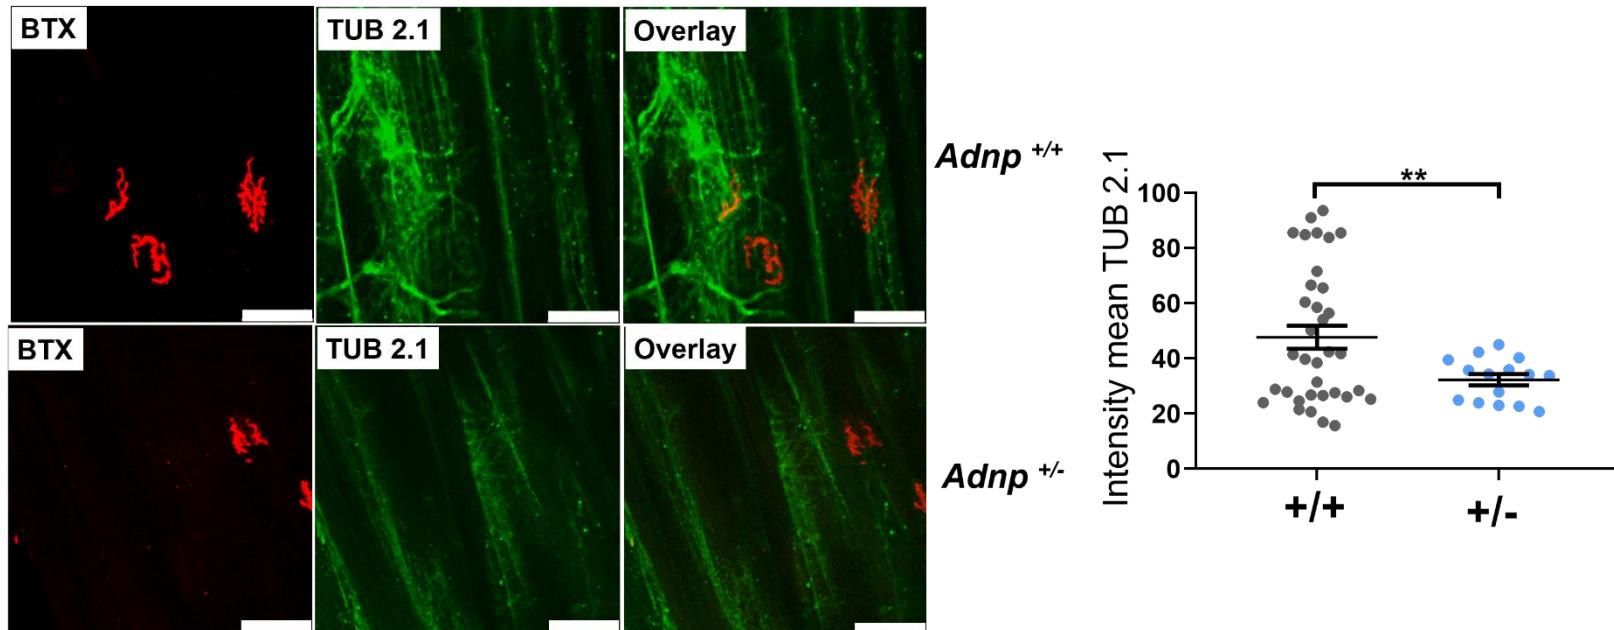

Figure S4. Representative whole-mount NMJ immunostaining of 14-month-old (*Adnp*^{+/+} CB n=4; *Adnp*^{+/-} CB n=2) male mice. The post-synaptic marker bungarotoxin was labeled by BTX (red) and the pre-synaptic marker Tubulin was labeled by Tub 2.1 (green). Decreased tubulin intensity was observed in *Adnp*^{+/-} CB, compared with *Adnp*^{+/+} CB, (**p<0.01). The images were acquired by confocal microscope at X20 magnification. Scale bar, 50 μ m. The intensity mean is expressed as mean \pm SEM.

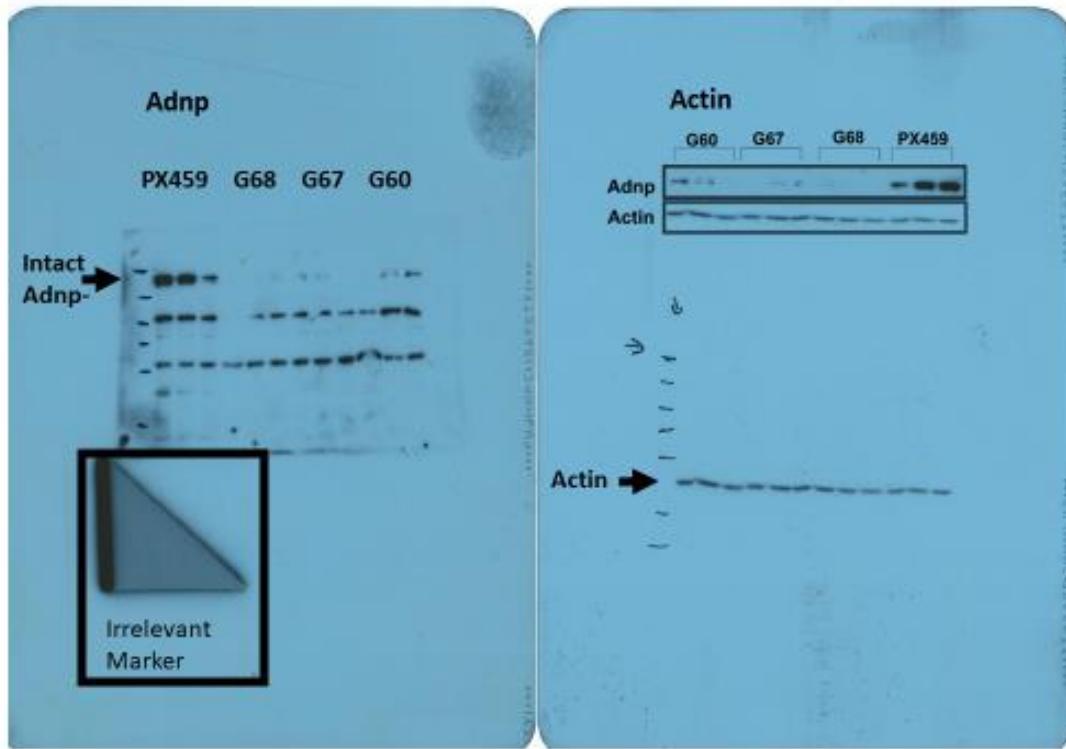

Figure S5. A successful knockdown of Adnp in culture by the CRISPR-Cas9 technology: Full Western blot control for Figure 7B. The left hand panel depicts the full Adnp Western blot results (an irrelevant marker was inserted for placement). Intact Adnp is indicated by a black arrow (experiments were performed in triplicates, as shown in the main text and in the insert – on the right side of the figure). The lower molecular weight bands identified by the Adnp antibody may represent breakdown products or non-specific antibody label. Regardless, complete knockdown of the intact Adnp is shown for the G68 sgRNA. The actin detecting antibody is highly specific (right hand panel).

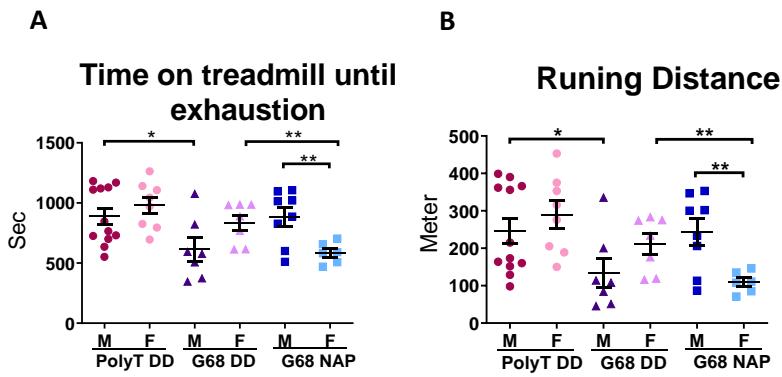

Figure S6. G68 male mice displayed a significantly reduced max ability to run on treadmill compared with the Poly T DD group.
 An unpaired Student's t-test revealed a significant reduction in time until exhaustion (A) and the running distance (B) in G68 male mice group compared to the control group (Poly T DD) ($*p<0.05$). Also, sex differences were observed in NAP treated G68 group ($**p<0.01$). Poly T (males n=12; females n=8), G68 DD (males n=7; females n=7) and G68 NAP groups (males n= 8; females n=7). All the results are expressed as mean \pm SEM.

Interlimb Coordination:

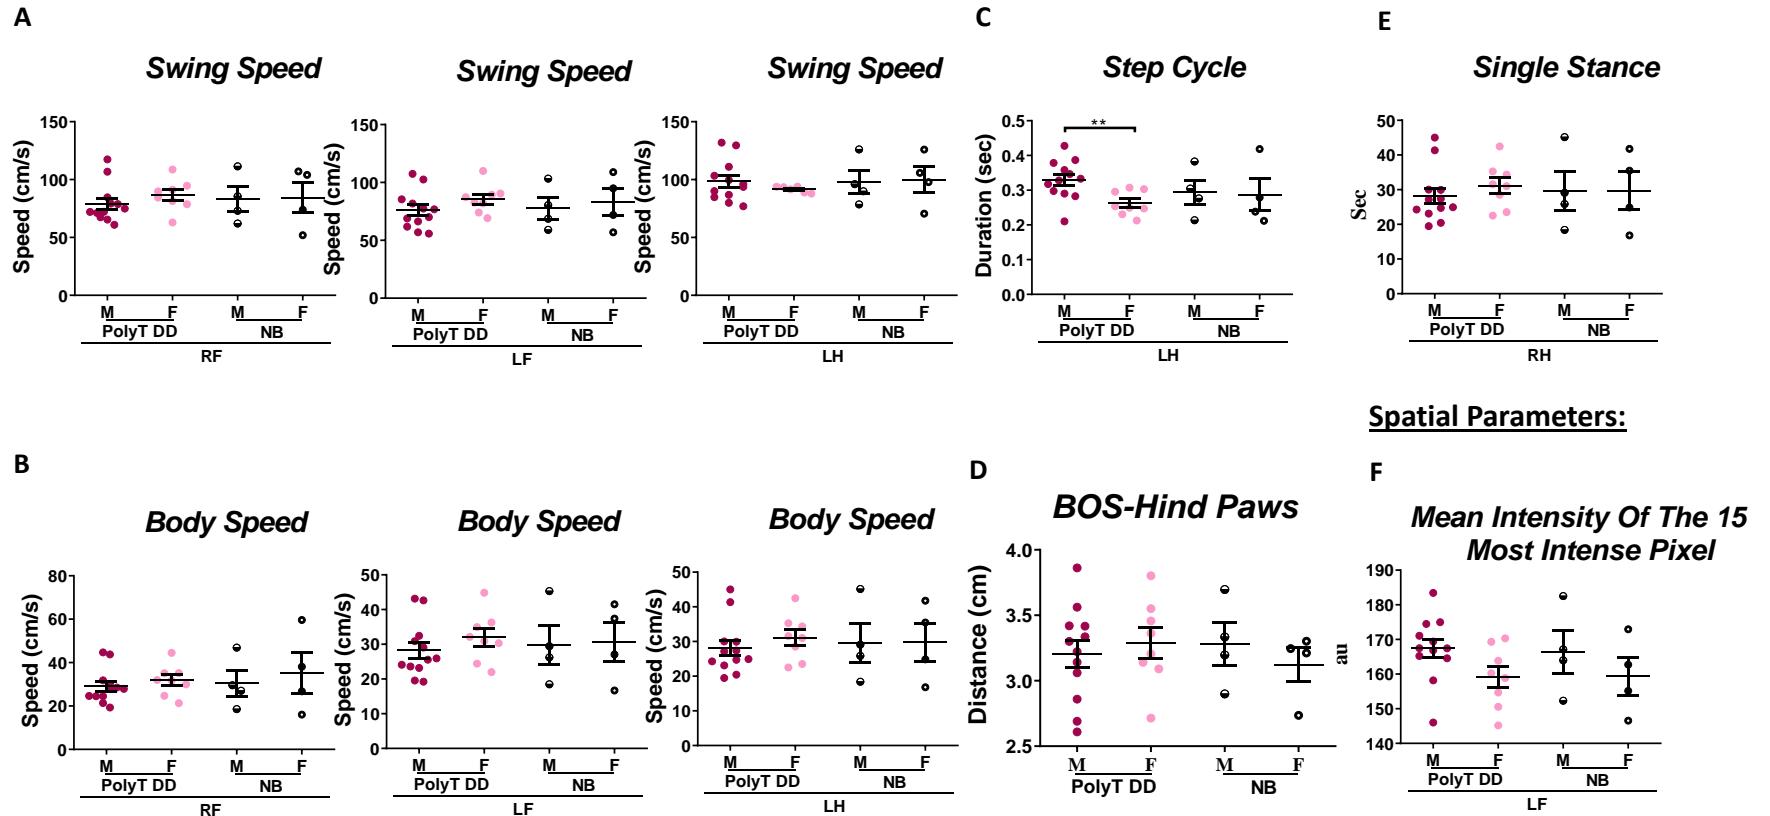

Figure S7. No significant differences were found between the Poly T DD and the neurobasal (NB) medium injected groups. Poly T (males n=12; females n=8), G68 DD (males n=7; females n=7) and G68 NAP groups (males n= 8; females n=7). All the results are expressed as mean \pm SEM.
