

Figure S1: Hepatic lipid metabolism 30 weeks after normal chow and high fat diet (HFD). mRNA level of markers related to (A) lipolysis, (B) lipid droplet coating, and (C) lipogenesis from wild type and *Plin5* null mouse livers (n = 4-7 animals/group) were quantified and analyzed after the end of the experiment. Data of the mRNA levels are expressed as mean \pm SD. Statistical analysis was performed with the Student's *t* test. **p* < 0.05; ***p* < 0.01; ****p* < 0.001. Abbreviations used are: *Agpat-*1, 1-acylglycerol-3-phosphate acyltransferase 1; *Ampk*, 5' AMP-activated protein kinase; *Atgl*, adipose triglyceride lipase; *Cgi-58*, comparative gene identification-58; *Dgat-*1/2, diacylglycerol acyltransferase 1/2; *Dgl*, diacylglycerol lipase; *Gpat*, Glycerol-3-phosphate acyltransferase; *Hsl*, hormone-sensitive lipase; HFD, high fat diet; *Htgl*, hepatic triglyceride lipase; *Mgl*, monoacylglycerol lipase; *Plin2*/3/4/5, perilipin 2/3/4/5; *Pnpla3*, Patatin-like phospholipase domain-containing protein 3; *Ppa-*2: inorganic pyrophosphatase 2; Srebp1 α /1c/2, sterol regulatory element-binding protein 1 α /1c/2; TG, triglycerides.

Table S3. Differentially expressed proteins in liver extracts of wild type and *Plin5-/-* mice that received a normal chow

LC-MS/MS analysis was performed of wild type (WT) and $Plin5^{-/-}$ mouse livers fed on a normal chow for 30 weeks (n = 4-7 animals/group). Depicted are proteins identified by a minimum of two unique peptides that had differential expression between the two genotypes. Data are given as ratio of values for the $Plin5^{-/-}$ mouse livers to the WT ones. Only significant differences with pairwise p < 0.05 are given. * p < 0.05, ** p < 0.01, *** p < 0.001.

Table S5. Relative amounts of different fatty acids and lysophosphatidylcholines afterphospholipase A2 digest

Organic fractions of liver samples from wild type (WT) and *Plin5^{-/-}* mice, fed either a normal chow or a high fat diet, were digested with PLA₂. This digestion results in fatty acids (FA) formerly bound to the *sn*-2 position of phospholipids and the lysophospholipids with one residual FA in the *sn*-1 position. Data are given as mean ± SD in % of total FA and total lysophosphatidylcholines, respectively. Significant differences between WT and *Plin5^{-/-}* mice were determined using the Holm-Sidak method with $\alpha = 0.05$. Each row was analyzed individually, without assuming a consistent SD. The number of t tests was 12 for the FAs and 8 for LPCs. Significances are given as *p < 0.05, ** p < 0.01, *** p < 0.001.
