^a: indicates the concentrations were shown as milligram per litre (mg/L)

^b: indicates the concentrations were shown as milligram per gram (mg/g)

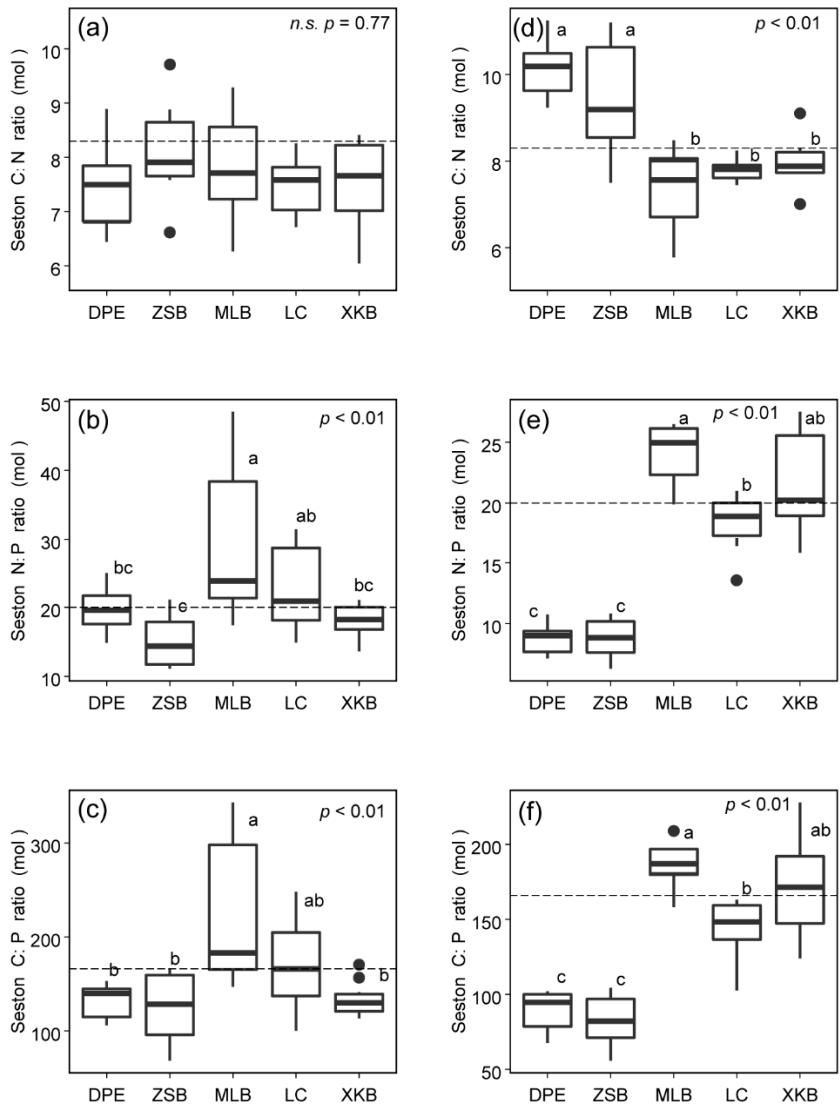

Fig. S1. Variations in seston stoichiometric ratio of C: N , N: P and C: P across different sites across Lake Taihu during the growing season (a-c) and senescence season (d-f). Dashed reference lines show the canonical lake C: N: P ratio. Letters denote significant differences between different locations and n.s. indicates no significant differences.

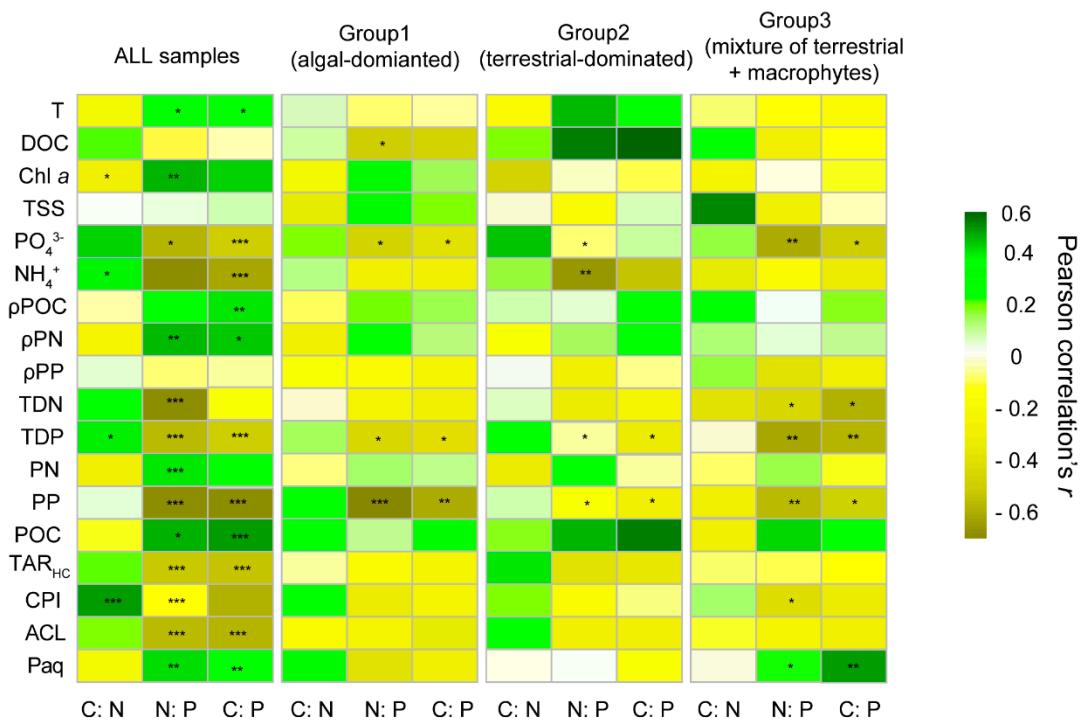

Fig. S2. Pearson correlation heatmap of variables and stoichiometric ratios in different seston sources.
 * indicates the p values in the correlations are lower than 0.05. ** indicates the p values in the correlations are lower than 0.01. *** indicates the p values in the correlations are lower than 0.001
