Supplementary Material

1.1. Reagents and Chemicals

Reference standards of 15 pharmaceuticals, 1 illegal drug (metabolite), and 4 pesticides and metabolites were purchased from Sigma-Aldrich (St Louis, MO, USA), LGC Promochem (London, UK), Toronto Research Chemicals (Ontario, Canada), Across Organics (Geel, Belgium), Bayer Hispania (Barcelona, Spain), Fort Dodge Veterinaria (Gerona, Spain), Vetoquinol Industrial (Madrid, Spain), and Aventis Pharma (Madrid, Spain). The main metabolite of cocaine, benzoylecgonine (BE), was obtained from Cerilliant (Round Rock, TX, USA).

Isotopically-labeled internal standards (ILIS) of acetaminophen-d₄, ibuprofen-d₃, diclofenac-d₄, valsartan-d₈, irbesartan-d₆, venlafaxine-d₆, and carbamazepine 10,11-epoxide-d₁₀ were acquired from CDN Isotopes (Quebec, Canada). Sulfamethoxazole-¹³C₆ and trimethoprim-¹³C₃ were from Cambridge Isotope Laboratories (Andover, MA, USA), and terbutylazine-d₅ from Dr. Ehrenstorfer (Augsburg, Germany). Benzoylecgonine-d₃ was purchased from Cerilliant as a solution in methanol.

Formic acid (HCOOH, content >98%), ammonium acetate (NH₄Ac, reagent grade), sodium hydroxide (NaOH, >99%), and HPLC-grade methanol (MeOH) were purchased from Scharlab (Barcelona, Spain). HPLC grade water was obtained from distilled water passed through a Milli-Q water purification system (Millipore, Bedford, MA, USA).

1.2. Instrumentation

A Waters Acquity ultra-performance liquid chromatography (UPLC) system (Waters, Milford, MA, USA) equipped with a binary solvent manager and a sample manager was interfaced to a triple quadrupole mass spectrometer Xevo TQS (Waters) equipped with an orthogonal Z-spray electrospray ionization interface (ESI). Capillary voltages were 3.5 kV and 3.0 kV in positive and negative ionization modes, respectively. Positive/negative switching mode was applied within the same run. Chromatography separation of the compounds was carried out with an Acquity UPLC BEH C18 analytical column (100 mm × 2.1 mm, 1.7 μm, Waters). An optimized gradient was used at a constant flow rate of 0.4 mL/min using mobile phases H₂O (A) and MeOH (B), both with 0.01% HCOOH and 1 mM NH₄Ac. The percentage of organic modifier (B) was changed linearly as follows: 0 min, 5%; 7 min, 90%; 8 min, 90%; 8.1 min, 5%; 10 min, 5%. The analysis run time was 10 min. The sample injection volume was 100 μL.

All data were acquired and processed using MassLynx v 4.1 software (Waters) (For further details, see Boix et al 2015).

Table SI-1. MS/MS parameters for the selected compounds. [ESI, Electrospray ionization mode; C.V., Cone voltage; Rt, Retention time; Q, Quantification transition; q₁, Confirmation transition; C.E., Collision energy; ILIS, isotopically labeled internal standards.]

Compounds	ESI	Rt (min)	C.V. (V)	Q	C.E. (eV)	q ₁	C.E. (eV)	q ₂	C.E (eV)
