

Supplementary Material 1: Results of the gap analysis from the “Assessment and Spatial Planning for Peatland Conservation and Restoration: Europe’s Trans-Border Neman River Basin as a Case Study”

Table 1 Fen gap analyses of protection within the Neman River sub-basins at 2 levels i) to meet the Convention of Biological Diversity target #11 as a proxy (17% protection in quantity) and ii) level i with the exclusion of protected fens that are drained (Convention of Biological Diversity’s targets 11, 14 and 15 relating to both quantity and quality). A minus value in the overall protection gap/surplus (E) column indicates that the current area amount (quantity) of protection is inadequate and conservation is required. Whereas column F indicates both area quantity and quality by excluding protected peatlands that are impacted by drainage. Note: columns A to F refer to section “2.4.1 Procedure” in the main document.

Table 2. Transition mire gap analyses of protection within the Nemean River sub-basins at 2 levels i) to meet the Convention of Biological Diversity target #11 as a proxy (17% protection in quantity) and ii) level i with the exclusion of protected transition mires that are drained (Convention of Biological Diversity's targets 11, 14 and 15 relating to both quantity and quality). A minus value in the overall protection gap/surplus (E) column indicates that the current area amount (quantity) of protection is inadequate and conservation is required. Whereas column F indicates both area quantity and quality by excluding protected peatlands that are impacted by drainage. Note: columns A to F refer to section “2.4.1 Procedure” in the main document.
