Table S1. Changes in concentration, presented as fold values, for all metabolites detected in the BBD community after 24 h exposure to 50 µg/L MC-LR as calculated from MetaboAnalyst 2.5 processed data. Metabolites in the microcystin treated community with the most robust differences ($p \leq 0.05$ and fold change ≥ 1.5) from the control ($t = 24$, no exposure to microcystin) are bolded. Other potentially interesting metabolites with less robust changes ($p \leq 0.1$ and/or fold change ≥ 1.25) are bolded and italicized.

Note: the method used cannot differentiate between D-Sedoheptulose-1-phosphate and D-Sedoheptulose-7-phosphate. Therefore, the two observed peaks are both ambiguously labeled as D-Sedoheptulose-1 or 7-phosphate.
